Overview

What Is the Proposed Re-evaluation Decision?

After a re-evaluation of the herbicide glyphosate, Health Canada's Pest Management Regulatory Agency (PMRA), under the authority of the *Pest Control Products Act* and Regulations, is proposing continued registration of products containing glyphosate for sale and use in Canada.

An evaluation of available scientific information found that products containing glyphosate do not present unacceptable risks to human health or the environment when used according to the proposed label directions. As a condition of the continued registration of glyphosate uses, new risk reduction measures are proposed for the end-use products registered in Canada. No additional data are being requested at this time.

This proposal affects the products containing glyphosate registered in Canada. Once the final re-evaluation decision is made, the registrant will be instructed on how to address any new requirements.

This Proposed Re-evaluation Decision is a consultation document[1] that summarizes the science evaluation for glyphosate and presents the reasons for the proposed re-evaluation decision. It also proposes new risk reduction measures to further protect human health and the environment.

The information is presented in two parts. The Overview describes the regulatory process and key points of the evaluation, while the Science Evaluation provides detailed technical information on the assessment of glyphosate.

The PMRA will accept written comments on this proposal up to 60 days from the date of publication of this document. Please forward all comments to Publications (please see contact information indicated on the cover page of this document).

What Does Health Canada Consider When Making a Re-evaluation Decision?

Health Canada's pesticide re-evaluation program considers potential risks as well as the value of pesticide products to ensure they meet modern standards established to protect human health and the environment. Re-evaluation draws on data from registrants, published scientific reports, information from other regulatory agencies and any other relevant information.

In 2010, Health Canada published a re-evaluation work plan for glyphosate (REV2010-02) outlining the focus of this re-evaluation and indicating that the PMRA is working cooperatively with the United States Environmental Protection Agency on the re-evaluation of glyphosate. As part of this re-evaluation, the effect of Polyethoxylated Tallow Amines (POEA) and the metabolite and transformation product Aminomethylphosphonic acid (AMPA) are also included.

[1] "Consultation statement" as required by subsection 28(2) of the *Pest Control Products Act.*

For more details on the information presented in this overview, please refer to the Science Evaluation section of this consultation document.

What Is Glyphosate?

Glyphosate is a non-selective herbicide registered for post-emergence control of a wide spectrum of weeds including annual and perennial broadleaf and grassy weeds, weedy trees and brush. It is registered under various forms including glyphosate acid, glyphosate isopropylamine or ethanolamine salt, glyphosate mono-ammonium or diammonium salt, glyphosate potassium salt and glyphosate dimethylamine salt. Another form, glyphosate trimethylsulfonium salt, was voluntarily discontinued by the registrant and therefore is not included in the current re-evaluation.

Glyphosate is registered for use on the following Use-Site Categories (USC): Forests and Woodlots, Industrial Oil Seed Crops and Fibre Crops, Terrestrial Feed Crops, Terrestrial Food Crops, Industrial and Domestic Vegetation Control Non-food Sites, Ornamentals Outdoors and Turf.

Glyphosate products are formulated as solutions, pastes or tablets and can be applied using ground or aerial equipment. Some special application techniques are also used.

Health Considerations

Can Approved Uses of Glyphosate Affect Human Health?

Products containing glyphosate acid are unlikely to affect your health when used according to label directions.

Potential exposure to glyphosate may occur through the diet (food and water), when handling and applying the products containing glyphosate, or by entering treated sites. When assessing health risks, two key factors are considered: the levels at which no health effects occur in animal testing and the levels to which people may be exposed. The dose levels used to assess risks are established to protect the most sensitive human population (for example, children and nursing mothers). Only uses for which exposure is well below levels that cause no effects in animal testing are considered acceptable for registration.

Toxicology studies in laboratory animals describe potential health effects from varying levels of exposure to a chemical and identify the dose at which no effects are observed. The health effects noted in animals occur at doses more than 100 times higher (and often much higher) than levels to which humans are normally exposed when glyphosate products are used according to label directions.

In laboratory animals, glyphosate was of low acute oral, dermal and inhalation toxicity. Glyphosate did not cause skin irritation or an allergic skin reaction. It was severely irritating to the eyes.

Short and long term (lifetime) animal toxicity tests, as well as numerous peer-reviewed studies from the published scientific literature were assessed for the potential of glyphosate to cause neurotoxicity, immunotoxicity, chronic toxicity, cancer, reproductive and developmental toxicity, and various other effects. The most sensitive endpoints used for risk assessment included clinical signs of toxicity and developmental effects. There was no indication that the young were more sensitive than the adult animal. The risk assessment approach ensures that the level of exposure to humans is well below the lowest dose at which these effects occurred in animal tests.

The World Health Organization's (WHO) International Agency for Research on Cancer (IARC) recently assigned a hazard classification for glyphosate as "probably carcinogenic to humans". It is important to note that a hazard classification is not a health risk assessment. The level of human exposure, which determines the actual risk, was not taken into account by WHO (IARC). Pesticides are registered for use in Canada only if the level of exposure to Canadians does not cause any harmful effects, including cancer.

Residues in Food and Water

Dietary risks from food and water are not of concern.

Reference doses define levels to which an individual can be exposed over a single day (acute) or lifetime (chronic) and expect no adverse health effects. Generally, dietary exposure from food and water is acceptable if it is less than 100% of the acute reference dose or chronic reference dose (acceptable daily intake). An acceptable daily intake is an estimate of the level of daily exposure to a pesticide residue that, over a lifetime, is believed to have no significant harmful effects.

Potential acute and chronic dietary exposures to glyphosate were estimated from residues of glyphosate and relevant metabolites in both treated crops and drinking water. Exposure to different subpopulations, including children and women of reproductive age, were considered. The acute dietary exposure estimate (in other words, from food and drinking water) at the 95^{th} percentile represents 31% of the acute reference dose (ARfD) for females 13-49 years of age and ranges from 12% to 45% of the ARfD for all other population subgroups. The chronic dietary exposure estimate for the general population represents 30% of the acceptable daily intake (ADI). Exposure estimates for population subgroups range from 20% of the ADI (for adults aged 50 years or older) to 70% of the ADI (for children 1-2 years old). Thus, acute and chronic dietary risks are not of concern.

The *Food and Drugs Act* prohibits the sale of adulterated food; that is, food containing a pesticide residue that exceeds the established maximum residue limit (MRL). Pesticide MRLs are established for *Food and Drugs Act* purposes through the evaluation of scientific data under the *Pest Control Products Act.* Each MRL value defines the maximum concentration in parts per million (ppm) of a pesticide allowed in or on certain foods. Food containing a pesticide residue that does not exceed the established MRL does not pose a health risk concern.

Canadian MRLs for glyphosate are currently specified for a wide range of commodities (MRL database). Residues in all other agricultural commodities, including those approved for treatment in Canada but without a specific MRL, are regulated under Subsection B.15.002(1) of the Food and Drug Regulations, which requires that residues do not exceed 0.1 ppm. The current MRLs for glyphosate can be found in Appendix VII of this document. Separate MRLs have been established for the trimethylsulfonium (TMS) cation, the major metabolite of the glyphosate-TMS salt, in/on a variety of commodities. Given that all glyphosate-TMS-containing products have been discontinued, it is proposed that all MRLs for the TMS cation be revoked.

Risks in Residential and Other Non-Occupational Environments

Non-occupational risks are not of concern when used according to label directions.

Residential exposure may occur from the application of products containing glyphosate to residential lawns, and turf (including golf courses). Residential handler exposure would occur from mixing, loading and applying domestic-class glyphosate products. These products can be applied as a liquid by a manually pressurized handwand, backpack, sprinkler can and ready-to-use sprayer.

Residential postapplication exposure may occur while performing activities on treated areas. Treated areas include areas treated by residential handlers as well as residential areas treated by commercial applicators. Exposure would be predominantly dermal. Incidental oral exposure may also occur for children (1 to < 2 years old) playing in treated areas.

For all domestic class products, the target dermal and inhalation margins of exposure (MOE) were met for adults applying glyphosate and are not of concern. Residential postapplication activities also met the target dermal MOE for all populations (including golfers) and are not of concern. For incidental oral exposure, the target oral MOEs were met for children (1 to < 2 years old) and are not of concern.

Non-occupational scenarios were aggregated with background (chronic) dietary exposure (food and drinking water). The resulting aggregate risk estimates reached the target MOE for all uses and are not of concern.

Non-occupational risks from bystander dermal exposure are not of concern.

Bystander exposure may occur when the general public enter non-cropland areas (for example, hiking through forests or parks) that have recently been treated with glyphosate. The resulting risk estimates associated with bystander dermal exposure exceeded the target MOE for all populations and are not of concern.

Occupational Risks from Handling Glyphosate

Occupational risks to handlers are not of concern when used according to label directions.

Risks to handlers are not of concern for all scenarios. Based on the precautions and directions for use on the original product labels reviewed for this re-evaluation, risk estimates associated with mixing, loading and applying activities exceeded target dermal and inhalation MOEs and are not of concern.

Postapplication risks are not of concern for all uses.

Postapplication occupational risk assessments consider exposures to workers entering treated sites in agriculture. Based on the current use pattern for agricultural scenarios reviewed for this re-evaluation, postapplication risks to workers performing activities, such as scouting, exceeded target dermal MOEs and are not of concern. A restricted entry interval of 12 hours is proposed for agricultural sites.

Polyethoxylated Tallow Amines

POEA is a family of several compounds that are used as surfactants in many glyphosate products registered in Canada. No human health risks of concern were identified, provided end-use products contain no more than 20% POEA by weight. All of the currently registered glyphosate end-use products in Canada meet this limit.

Environmental Considerations

What Happens When Glyphosate Is Introduced Into the Environment?

When used according to proposed label directions, glyphosate products do not pose an unacceptable risk to the environment. Labelled risk-reduction measures mitigate potential risks posed by glyphosate formulations to non-target plants and freshwater/marine/estuarine organisms.

When glyphosate is released into the environment, it can enter soil and surface water. Glyphosate breaks down in soil and water and is not expected to persist for long periods of time. Glyphosate produces one major transformation product in soil and water, aminomethyl phosphonic acid (AMPA), which can persist in the environment. Carryover of glyphosate and AMPA into the next growing season is not expected to be significant. Glyphosate and AMPA are not expected to move downward through the soil and are unlikely to enter groundwater.

Glyphosate dissolves readily in water but is expected to move into sediments in aquatic environments. Glyphosate is not expected to enter the atmosphere. Glyphosate and AMPA are unlikely to accumulate in animal tissues.

Certain glyphosate formulations include a surfactant composed of POEA compounds. At high enough concentrations, POEA is toxic to aquatic organisms but is not expected to persist in the environment. While, in general, glyphosate formulations that contain POEA are more toxic to freshwater and marine/estuarine organisms than formulations that do not contain POEA, they do not pose an unacceptable risk to the environment when used as directed on the label.

In the terrestrial environment the only area of risk concern identified from the available data was for terrestrial plants and therefore spray buffer zones are required to reduce exposure to sensitive terrestrial plants.

Glyphosate formulations pose a negligible risk to freshwater fish and amphibians, but may pose a risk to freshwater algae, freshwater plants, marine/estuarine invertebrates and marine fish if exposed to high enough concentrations. Hazard statements and mitigation measures (spray buffer zones) are required on product labels to protect aquatic organisms.

Glyphosate, AMPA and POEA do not meet all Toxic Substances Management Policy (TSMP) Track 1 criteria and are not considered Track 1 substances. Other than incident reports of damage to plants, there are currently no environmental incident reports involving glyphosate in Canada.

Value Considerations

What is the Value of Glyphosate?

Glyphosate plays an important role in Canadian weed management in both agricultural production and non-agricultural land management and is the most widely used herbicide in Canada.

Glyphosate is an important herbicide for Canadian agriculture, for the following reasons:

- Due to its broad and flexible use pattern and its wide weed-control spectrum, it is the most widely used herbicide in several major crops grown in Canada such as canola, soybean, field corn and wheat. It is also one of only a few herbicides regularly used in fruit orchards such as apple.
- It is the essential herbicide for use on the glyphosate tolerant crops (GTCs) including canola, soybean, corn, sweet corn and sugar beet. The combination of GTCs and glyphosate has been adopted as an important agricultural production practice in Canada.
- It has a wide application window ranging from pre-seeding to after seeding (prior to crop emergence), in-crop, pre-harvest or post-harvest, providing a flexible and effective weed management program.
- It is one of few herbicides that can also be used as harvest management and desiccation treatment.
- Post-harvest stubble treatment with glyphosate allows reduced or zero tillage, which has facilitated the adoption of conservation agriculture that results in improved soil quality.

Glyphosate is also an important weed management tool and is widely used for weed control in non-agricultural land management, such as forestry, industrial areas, and along rights-of-way. It is an effective tool for control of many invasive weed species and is also used in the control of toxic plants such as poison ivy.

Proposed Measures to Minimize Risk

Labels of registered pesticide products include specific instructions for use. Directions include risk-reduction measures to protect human health and the environment. These directions must be followed by law. As a result of the re-evaluation of glyphosate, the PMRA is proposing further risk-reduction measures for product labels.

Human Health

- To protect workers entering treated sites a restricted-entry interval of 12 hours is proposed for agricultural uses.

- To protect bystanders, a statement indicating to apply only when the potential for drift to areas of human habitation or areas of human activity such as houses, cottages, schools and recreational areas is minimal is required.

Environment

- Environmental hazard statements to inform users of its toxicity to non-target species.

- Spray buffer zones to protect non-target terrestrial and aquatic habitats are required.

- To reduce the potential for runoff of glyphosate to adjacent aquatic habitats, precautionary statements for sites with characteristics that may be conducive to runoff and when heavy rain is forecasted are required. In addition, a vegetative strip between the treatment area and the edge of a water body is recommended to reduce runoff of glyphosate to aquatic areas.

What Additional Scientific Information is Being Requested?

There are no additional data requirements proposed as a condition of continued registration of glyphosate products.

Next Steps

Before making a final re-evaluation decision on glyphosate, the PMRA will consider any comments received from the public in response to this consultation document. A science-based approach will be applied in making a final decision on glyphosate. The PMRA will then publish a Re-evaluation Decision[2] that will include the decision, the reasons for it, a summary of comments received on the proposed decision and the PMRA's response to these comments.

[2] "Decision statement" as required by subsection 28(5) of the *Pest Control Products Act*.

Science Evaluation

1.0 Introduction

Glyphosate is a non-selective systemic herbicide. As an aminophosphonic analogue of the natural amino acid glycine, glyphosate is classified as a Weed Science Society of America Group 9 herbicide. It disrupts the shikimic acid pathway through inhibition of the enzyme 5-enolpyruvylshikimate-3-phosphate (EPSP) synthase. The resulting deficiency in EPSP production leads to reductions in aromatic amino acids (phenylalanine, tyrosine and tryptophan) that are vital for protein synthesis and plant growth.

Following the re-evaluation announcement for glyphosate, the registrants of the technical grade active ingredient indicated their support to continue registration of all uses included on the labels of end-use products (EPs) containing glyphosate in Canada. Registrants of all Canadian glyphosate products are listed in Appendix I.

2.0 The Technical Grade Active Ingredient, Its Properties and Uses

2.1 Identity of the Technical Grade Active Ingredient

Common Name			Glyphosate
Function			Herbicide
Chemical Family			Organophosphorus
Chemical Name			
	1	**International Union of Pure and Applied Chemistry (IUPAC)**	*N*-(phosphonomethyl)glycine
	2	**Chemical Abstracts Service (CAS)**	*N*-(phosphonomethyl)glycine
CAS Registry Number			1071-83-6
Molecular Formula			$C_3H_8NO_5P$
Structural Formula			Molecular Weight			169.1

The purity (in other words, guarantee) of the currently registered technical grade active ingredient is provided in Appendix I.

Identity of relevant impurities of human health or environmental concern include the following:

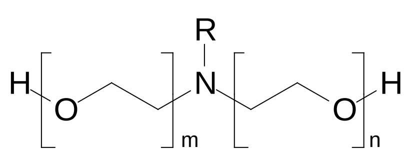
Based on the manufacturing process used, impurities of human health or environmental concern as identified in the *Canada Gazette,* Part II, Vol. 142, No. 13, SI/2008-67 (2008-06-25), including TSMP Track 1 substances, are not expected to be present in the product.

2.2 Physical and Chemical Properties of the Technical Grade Active Ingredient

Property	**Result**
Vapour pressure at 25°C	1.31×10^{-2} mPa
Ultraviolet (UV) / visible spectrum	Not expected to absorb at λ > 300 nm
Solubility in water at 20°C	10.5 g/L (pH 1.9)
n-Octanol/water partition coefficient at 20 °C	Log K_{ow} < -3.2 (pH 2-5); $K_{ow} < 6.3 \times 10^{-4}$
Dissociation constant (p*K*a)	2.34 (20ºC), 5.73 (20ºC), 10.2 (25ºC)

2.3 Polyethoxylated Tallow Amines

Polyethoxylated tallow amines (POEA) are surfactants consisting of a family of many compounds. The general structure for POEA is as follows:



In Canada, majority of the currently registered glyphosate end-use products contain the surfactant POEA.

2.4 Description of Registered Glyphosate Uses

Appendix I lists all glyphosate products that are registered under the authority of the *Pest Control Products Act* as of 3 May 2012. A total of 169 products contain glyphosate including 19 technical grade active ingredients, 19 Manufacturing Concentration, 97 Commercial Class end-use products and 34 Domestic Class end-use products. Although glyphosate is registered in various forms, there are no differences in efficacy and toxicity end-points among glyphosate forms. Therefore, the assessments were based on the glyphosate acid form.

Appendix IIa and IIb list all the Commercial Class and Domestic Class uses, respectively, for which glyphosate is currently registered. All uses including uses registered through the PMRA User Requested Minor Use Label Expansion (URMULE) program were supported by the registrants at the time of initiation of re-evaluation and were therefore considered in the health and environmental risk assessments. Under the URMULE program, the data supporting the minor use registrations are generated by a user group or by the Pest Management Centre of Agriculture and Agri-Food Canada.

Uses of glyphosate belong to the following use site categories: Forests and Woodlots (Use-Site Category (USC 4), Industrial Oil Seed Crops and Fibre Crops (USC 7), Terrestrial Feed Crops (USC 13), Terrestrial Food Crops (USC 14), Industrial and Domestic Vegetation Control Non-food Sites (USC 16), Ornamentals Outdoors (USC 27) and Turf (USC 30).

3.0 Impact on Human and Animal Health

3.1 Toxicology Summary

The toxicology database for glyphosate acid (hereafter called glyphosate) was extensive, consisting of all guideline toxicity studies required to characterize toxicity of a pesticide. For each study type currently required, several studies were available to satisfy the data requirements. Considered individually, some of these studies do not meet the current standards for testing, although they were considered acceptable at the time of their initial evaluation. Overall, the database was considered adequate to define the majority of the toxic effects that may result from exposure to glyphosate. Relevant acceptable scientific studies published in the peer-reviewed literature were also incorporated into the hazard assessment, including those studies that were considered by the World Health Organization's (WHO) International Agency for Research on Cancer (IARC) in their recent hazard classification for glyphosate. Hazard identification, including carcinogenic potential, is an important component in the determination of the potential human health risk of a pesticide. The determination of such risk, however, is not solely driven by the hazard profile but is also a function of the potential exposure to the pesticide. For this reason, both the hazard and exposure potential must be considered together when performing a human health risk assessment for a pesticide, since an identified hazard may be offset by the fact that the potential for human exposure is considered to be sufficiently low so as not to pose a risk of concern to human health.

Metabolism studies in rats indicated that glyphosate was incompletely but rapidly absorbed following administration of single low, single high and repeated oral doses. At low doses, the peak plasma concentration was reached within an hour of dosing. Following single high doses, the peak plasma concentration was reached five hours after dosing. The bioavailable fraction was about 20-23%. The parent compound was the primary form detected in tissues and excreta, indicating glyphosate was not metabolized extensively. Approximately 1-5% of the administered dose (AD) was distributed in the gastrointestinal (GI) tract, liver, kidneys, bone, lungs, spleen, salivary glands and brain. The distribution phase was rapid with a distribution half-life of 20-30 minutes. About 1-9% of the AD was metabolized to aminomethylphosphonic acid (AMPA). Higher quantities (6-9% of AD) of AMPA were detected in feces than in urine

(≤1% of AD). In single low- or high-dose oral studies, the excretion of glyphosate was rapid and nearly complete after 72 hours. The primary route of excretion was the feces (80-90% of AD) followed by urine (10-20% of AD) following single low, single high, and repeated oral doses. The elimination half-life of glyphosate was around 14 hours while the elimination half-life of AMPA was approximately 15 hours following oral doses of glyphosate.

Glyphosate was of low acute oral and inhalation toxicity in the rat, and of low dermal toxicity in the rabbit. Glyphosate was neither a dermal irritant nor a dermal sensitizer. It was severely irritating to rabbit eyes.

In oral repeat-dose toxicity studies, effects on salivary glands in rodents, decreased body weight, body-weight gain, and clinical signs of toxicity were consistently observed in all test species. Additional target organs of toxicity were liver and kidney in rats and dogs, and stomach in mice in most of these studies at higher dose levels. Changes in several clinical chemistry parameters were consistent with a mild dehydration. The high doses in most studies reached or exceeded the limit dose of testing (in other words, 1000 mg/kg bw/day) due to the low toxicity of glyphosate.

In guideline and non-guideline (National Toxicology Program-NTP) 90-day oral studies in rodents, the primary effect in rats was an increased incidence and severity of cytoplasmic alterations of the parotid and submandibular glands. Although this effect was also noted in mice, it occurred at a dose that exceeded the limit dose. The effects in the parotid gland in Sprague Dawley rats was considered to be at the threshold of toxicological adversity at the lowest dose tested (30 mg/kg bw/day) due to the mild nature of this effect, and given that these effects in the rat salivary glands were commonly observed starting at 100 mg/kg bw/day in other toxicity studies. In a 28-day oral study, salivary gland effects were noted in three rat strains at the limit dose, but with varying degrees of severity and reversibility. A 14-day mechanistic oral study in rats designed to test the hypothesis that the salivary gland effects of glyphosate were mediated through an adrenergic pathway did not provide conclusive evidence to substantiate this mechanism.

Other effects noted in the short-term studies included increased kidney and lungs weights in male mice, and decreased thymus weights, body weight, body-weight gain, and increased plasma bile acids in rats. In addition, decreased sperm counts were also noted in rats at dose groups where sperm analysis was conducted (three highest doses), with increased testis weights observed at higher dose levels. However, no effects were observed in the other examined sperm parameters (epididymal weights, epididymal sperm motility, total spermatid heads, and total spermatid heads/gram caudal tissue). The estrus cycle length was also slightly longer (5.4 days compared to 4.9 days) in the high-dose females.

In the 21-day dermal toxicity studies in rats and rabbits, no treatment-related systemic or dermal effects were noted in Wistar rats at doses up to 1000 mg/kg bw/day, while SD rats had increased incidences of erythema and desquamation of the skin and increased incidences of unilateral papillary necrosis, urothelial hyperplasia and pelvic dilation in the kidneys at this dose. Slight dermal irritation, but no systemic toxicity was observed in New Zealand White (NZW) rabbits. In a 90-day dog study, the only adverse effects noted were decreases in several clinical chemistry parameters at a very high dose, which were consistent with decreased food consumption.

Decreased ovary weights and increased serum ALP were also observed in females at the high dose. Three 12-month dog studies reported more systemic toxicity (body weight and epididymal effects) at lower dose levels in males compared to females. However, males were not more sensitive than females in other test species. One 12-month study had increased incidences of clinical signs of toxicity and increased liver and kidney weights in males. A second study reported a dose-related increased incidence of lymphoid nodules in the epididymis and decreased pituitary weight in males, with kidney tubular regeneration accompanied by epithelial cells and urinary protein in females at this same dose. Increased absolute and relative testis and ovary weights were found in the high-dose group.

A third study reported decreased levels of plasma phosphorus, decreased epididymides weights and increased transitional epithelial hyperplasia in the kidneys in males, with decreased plasma phosphorus levels and thyroid weights in the high-dose females only.

Glyphosate was not genotoxic in the standard battery of in vitro and in vivo tests assessing gene mutation, chromosome aberration, and mouse micronucleus anomalies. There was no evidence of carcinogenicity in four long-term rat studies. In mice, treatment with glyphosate was associated with a marginal increase in the incidence of unilateral tubulostromal adenomas in the ovaries, but only at the limit dose of testing. Although historical control data were unavailable, based on the marginal increase in the incidence of the ovarian tumours coupled with its occurrence at the limit dose and the negative findings in a battery of genotoxicity assays, these tumours were considered to be of low concern for human health risk assessment.

Chronic effects were assessed in four long-term rat toxicity studies. One study did not elicit any overt toxicity as the dose range was insufficiently high, whereas the high-dose group in the other three studies either exceeded or was at the limit dose of testing. Effects included increased incidences and severity of cellular alteration in the submandibular and parotid glands, and inflammation and hyperplasia of the squamous mucosa in the stomach in both sexes; decreased and/or absence of epididymal sperm, degeneration of seminiferous tubules, increased testis weight and testicular effects, and myeloid hyperplasia of the bone marrow in males; and increased kidney papillary necrosis in females. At or above the limit dose, males had a marginally increased incidence of necrosis in the glandular stomach and an increase in kidney papillary necrosis and prostatitis, while females had increased incidences of mammary gland hyperplasia and cataracts/lens fiber degeneration.

In three gavage rat developmental-toxicity studies, the high doses reached or exceeded the limit dose and no evidence for sensitivity of the young was observed. Maternal toxicity occurred at the limit dose in rats and included clinical signs of toxicity (salivation, and noisy respiration), hydronephrosis and one total litter resorption. In addition, mortality, and decreased body weight and body-weight gain were observed at doses above the limit dose. Developmental toxicity was also observed only at or above the limit dose. Effects comprised an increased incidence of skeletal variants, wavy ribs/rib distortions and hydroureter. Decreased fetal weight, reduced ossification, decreased numbers of viable fetuses/dam, and an increased incidence of absent kidneys and ureters were also observed at a dose that exceeded the limit dose by over three-fold. In three gavage developmental toxicity studies in rabbits, maternal toxicity comprised mainly of GI disturbances at similar dose levels, with excessive maternal mortality occurring at higher doses in one study. Post-implantation loss and intra-uterine deaths were commonly noted at the highest dose tested. Developmental toxicity included decreased fetal body weight, reduced ossification, and increased incidences of 27th presacral vertebrae, and 13th rudimentary and full ribs. In one study an increased incidence of fetal cardiovascular variations accompanied with an increased incidence of fetal cardiovascular malformations (mainly interventricular septal defects) was noted at the highest dose tested. The observation of cardiovascular malformations was considered a serious effect in this study, although maternal toxicity was present at the same dose level. No evidence of sensitivity of the young was noted.

The reproductive toxicity of glyphosate was investigated in three, two-generation toxicity studies in rats. In two of these studies, the high dose reached or exceeded the limit dose. Parental toxicity included an increased incidence of hypertrophy of acinar cells with granular cytoplasm in the parotid and submandibular glands in both parental generations. At doses at or above the limit dose, there was decreased body weight and an increased incidence of soft stools or diarrhea in both parental generations, decreased body weight during gestation in F_1 females, increased liver and kidney weights in the P generation with increased incidences of transitional epithelial hyperplasia in the kidney, and glandular and luminal dilatation of the uterus in the F_1 generation. Reproduction toxicity was noted only at a dose that exceeded the limit dose and included decreased litter size with no increase in the number of dead pups per litter. There were no effects on mating, pregnancy and fertility indices, sperm parameters, or reproductive performance. However, an increased mean number of estrual cycles (P generation) and decreased mean estrual cycle length (P and F_1 generations) in females was noted at the limit dose. Offspring toxicity consisted primarily of decreased body weight in pups. At doses at or exceeding the limit dose, there were decreases in litter size, a marginal increase in tubular dilatation/cysts in the kidneys, decreased pup spleen and thymus weights and an increased incidence of unilateral and bilateral pelvic dilatation of the kidneys. Although decreased body weight in pups was observed at non-maternally toxic dose in two of the three studies, this reduction in body weight was considered marginal and evidence from other studies in rats indicated that effects on the salivary glands (not assessed in these two reproduction toxicity studies) would be expected to occur at this dose level in the adult animals. Thus, no evidence of sensitivity of the young was observed in these reproduction toxicity studies.

The neurotoxic potential of glyphosate was investigated in acute and 90-day oral neurotoxicity studies in rats. In the acute oral (gavage) neurotoxicity study, decreased motor activity was observed in females on the first day of dosing. An increased incidence of reduced splay reflex and decreased motor activity in males was observed along with other findings (decreased activity, subdued behaviour, hunched posture, pinched in sides, tip-toe gait, hypothermia, abnormal respiratory noise, diarrhea, and a single mortality in females) at a dose level that was two-fold greater than the limit dose. In the 90-day dietary neurotoxicity study, decreased body-weight gain and food efficiency were noted in males. In the high-dose group, decreased body weight and an increased incidence of decreased pupillary response to light were observed in males. Decreased body-weight gain and motor activity on week 5 were observed in females of the high-dose group. Overall, findings in both acute and short-term neurotoxicity studies were considered to reflect systemic/general toxicity rather than evidence of selective neurotoxicity.

In a 28-day immunotoxicity study, dose-related increased T-cell dependent antibody response and total spleen activity were observed in the test animals. In addition, a non-dose related increase in spleen cellularity was noted. Although this test was designed to examine immunosuppression, an altered function of the immune system could not be ruled out.

Epidemiology

A number of published epidemiology studies were reviewed for incorporation into the hazard assessment of glyphosate, which included the subset of epidemiological information considered by the WHO (IARC) in their summary report for glyphosate. However, the majority lacked adequate characterization of glyphosate exposure, rendering them of limited use for supplementing the hazard assessment. A prospective cohort study of licensed pesticide applicators in Iowa and North Carolina, known as the Agricultural Health Study, examined the relationship between glyphosate exposure and cancer incidence. The most relevant finding in this study was the suggested association between multiple myeloma and glyphosate exposure. However, a number of confounding factors (for example, the lack of consideration of exposure to UV radiation from sunlight) rendered these findings inconclusive and chance occurrence could not be ruled out. The study investigators also indicated that this association required additional follow-up.

Cancer Assessment

In consideration of the strength and limitations of the large body of information on glyphosate, which included multiple short and long term (lifetime) animal toxicity studies, numerous in vivo and in vitro genotoxicity assays, as well as the large body of epidemiological information, the overall weight of evidence indicates that glyphosate is unlikely to pose a human cancer risk. This is consistent with all other pesticide regulatory authorities world-wide, including the most recent, ongoing comprehensive re-evaluation by Germany (Rapporteur Member State for the European Union) that was published for public consultation in 2014 (http://dar.efsa.europa.eu/dar-web/provision).

Toxicity Studies on the Metabolite Aminomethylphosphonic Acid

In a single dose metabolism study with radiolabelled metabolite aminomethylphosphonic acid (AMPA), absorption was incomplete. Small quantities of AMPA were recovered in most tissues, with the highest percent detected in the muscle and the GI tract. Over 90% of the AD was excreted as unchanged AMPA, indicating that AMPA was not further metabolized. Most of the excretion occurred via feces compared to urine. Overall, this study showed that AMPA possessed metabolic patterns that were similar to those of its parent compound, glyphosate.

AMPA was of low acute oral and dermal toxicity in the rat. AMPA was neither a dermal irritant in rabbits nor a dermal sensitizer in guinea pigs. It was minimally irritating to rabbit eyes.

In a 90-day oral study in rats, decreased liver weights were observed in males. An increased incidence and severity of mucosal hyperplasia of the bladder was also observed at a dose level greater the limit dose. Decreased body weight, and body-weight gain were observed in males.

An increased incidence of renal pelvic epithelial hyperplasia was observed at a dose that was about five-fold greater than the limit dose. In a supplemental oral 90-day study in rats, a slight reduction in body-weight gain in females and a slight increase in kidney weights in males were observed at the limit dose.

In a 30-day oral study in dogs, decreased red blood cell counts, hemoglobin concentration, and hematocrit levels were noted in females in all dose groups and in the high-dose group in males. Increased reticulocyte counts also accompanied these effects. However, in a 90-day oral study in dogs, no toxicity was observed at similar dose levels.

AMPA tested negative for gene mutation tests in bacteria and mammalian lymphoma cell lines and also tested negative in mouse micronucleus and unscheduled DNA synthesis assays.

In a gavage developmental toxicity study in rats, increased incidences of hair loss and soft and mucoid feces were noted in dams. Decreased body weight, body-weight gain and food consumption was observed at the limit dose of testing. Developmental toxicity included decreased body weight at the limit dose. No evidence of the sensitivity of the young was observed in this study. In a supplemental developmental toxicity study, no maternal toxicity was noted. Developmental toxicity included increased incidences of reduced ossification and skeletal variations.

Overall, based on the available toxicity studies, AMPA was considered of no greater toxicological concern than glyphosate. Although no repeated dose toxicity studies were available for glyphosate metabolites resulting from genetically modified organism (GMO) crops (in other words, N-acetylglyphosate and N-acetyl AMPA), these metabolites were not considered to be of a greater toxicological concern than the parent compound, glyphosate, based on a European Food Safety Authority assessment. In summary, glyphosate toxicology endpoints were considered adequate for the risk assessment of AMPA and the acetylated metabolites of glyphosate.

Results of the toxicology studies conducted on laboratory animals with glyphosate and AMPA are summarized in Table 1A and Table 1B of Appendix III, respectively. The toxicology endpoints for use in the human health risk assessment are summarized in Table 2 of Appendix III.

Pest Control Products Act Hazard Characterization

For assessing risks from potential residues in food or from products used in or around homes or schools, the *Pest Control Products Act* requires the application of an additional 10-fold factor to threshold effects to take into account the completeness of the data with respect to the exposure of and toxicity to infants and children, and potential prenatal and postnatal toxicity. A different factor may be determined to be appropriate on the basis of reliable scientific data.

With respect to completeness of the toxicity database as it pertains to the toxicity to infants and children, the database contains several studies for each type of required guideline study including developmental toxicity studies in rats and rabbits, and two-generation reproduction toxicity studies in rats. In addition, applicable studies from the published scientific literature were considered, including reviews of studies that were submitted to the European Union Glyphosate Task Force.

With respect to identified concerns relevant to the assessment of risk to infants and children, the two-generation reproduction toxicity studies in rats provided no indication of increased sensitivity of the young. In these studies, offspring toxicity commonly consisted of decreased body weight observed at dose levels that produced toxicity to the adult animals. In addition, the prenatal developmental toxicity studies in rats did not demonstrate increased sensitivity of the fetuses to in utero exposure of glyphosate. In these studies, decreased fetal weights and number of viable fetus/dam, in addition to developmental abnormalities (absent kidneys and ureters, skeletal variants, wavy ribs, a single incidence of hydroureter) were observed at dose levels that reached or exceeded the limit dose and produced moderate to severe toxicity in maternal animals.

In developmental toxicity studies in the rabbits, there was no observed increase in susceptibility of the fetuses to in utero exposure of glyphosate. In these studies, an increased incidence of reduced ossification at various sites was commonly noted at dose levels that produced maternal toxicity. In one of these studies, an increased incidence of fetal cardiovascular malformations, comprised mainly of interventricular septal defects, was noted in the presence of maternal toxicity at the highest dose tested.

Overall, the endpoints in the young were well characterized. The increased incidence of fetal cardiovascular malformations noted in a rabbit developmental toxicity study was considered a serious endpoint. However, the concern regarding the serious nature of this effect was tempered by the presence of maternal toxicity at the same and lower dose levels in this study. Therefore, the *Pest Control Products Act* factor was reduced to three-fold when this endpoint was used to establish the point of departure. For all other scenarios, the *Pest Control Products Act* factor was reduced to one-fold since there were no residual uncertainties with respect to the completeness of the data, or with respect to potential toxicity to infants and children.

3.2 Dietary Exposure and Risk Assessment

In a dietary exposure assessment, the PMRA determines how much of a pesticide residue, including residues in milk and meat, may be ingested with the daily diet. Exposure to glyphosate from potentially treated imported foods is also included in the assessment. These dietary assessments are age specific and incorporate the different eating habits of the population at various stages of life (infants, children, adolescents, adults and seniors). For example, the assessments take into account differences in children’s eating patterns, such as food preferences and the greater consumption of food relative to their body weight when compared to adults. Dietary risk is then determined by the combination of the exposure and the toxicity assessments. High toxicity may not indicate high risk if the exposure is low. Similarly, there may be risk from a pesticide with low toxicity if the exposure is high.

The PMRA considers limiting use of a pesticide when risk exceeds 100% of the reference dose. The PMRA Science Policy Note SPN2003-03, *Assessing Exposure from Pesticides, A User's Guide*, presents detailed acute, chronic and cancer-risk assessment procedures.

Residue estimates used in the dietary risk assessment may be based conservatively (in other words, use upperbound estimates) on the maximum residue limits (MRLs) or the field trial data representing the residues that may remain on food after treatment at the maximum label rate. Surveillance data representative of the national food supply may also be used to derive a more accurate estimate of residues that may remain on food when it is purchased. These include the Canadian Food Inspection Agency (CFIA) National Chemical Residue Monitoring Program and the United States Department of Agriculture Pesticide Data Program (USDA PDP). Specific and empirical processing factors as well as specific information regarding percent of crops treated may also be incorporated to the greatest extent possible.

In situations where the need to mitigate dietary exposure has been identified, the following options are considered. Dietary exposure from Canadian agricultural uses can be mitigated through changes in the use pattern. Revisions of the use pattern may include such actions as reducing the application rate or the number of seasonal applications, establishing longer pre-harvest intervals (PHIs), and/or removing uses from the label. In order to quantify the impact of such measures, new residue chemistry studies that reflect the revised use pattern would be required. These data would also be required in order to amend MRLs to the appropriate level. Imported commodities that have been treated also contribute to the dietary exposure and are routinely considered in the risk assessment. The mitigation of dietary exposure that may arise from treated imports is generally achieved through the amendment or specification of MRLs.

Acute and chronic exposure and risk assessments were conducted using the Dietary Exposure Evaluation Model – Food Commodity Intake Database^{TM} (DEEM-FCID^{TM}, Version 2.14), which incorporates consumption data from the United States Department of Agriculture (USDA) Continuing Surveys of Food Intakes by Individuals (CSFII) from 1994 to 1996 and 1998. For more information on dietary risk estimates or residue chemistry information used in the dietary assessment, see Appendices IV, V and VI.

3.2.1 Determination of Acute Reference Dose

General Population (Excluding Females 13-49 Years of Age)

To estimate acute dietary risk (one day), a rabbit developmental toxicity study with a no observed adverse effect level (NOAEL) of 100 mg/kg bw/day was selected for risk assessment. An increased incidence of soft stools and diarrhea was observed immediately following the start of dosing at 175 mg/kg bw/day. Standard uncertainty factors of 10-fold for interspecies extrapolation and 10-fold for intraspecies variability were applied. The *Pest Control Products Act* factor was reduced to one-fold for the reasons outlined in the *Pest Control Products Act* Hazard Characterization section. Therefore, the composite assessment factor (CAF) is 100.

The ARfD is calculated according to the following formula:

$$\textbf{ARfD} = \frac{\textbf{NOAEL}}{\textbf{CAF}} = \frac{\textbf{100 mg/kg bw/day}}{\textbf{100}} = \textbf{1.0 mg/kg bw of glyphosate}$$

Females 13-49 years of age

To estimate acute dietary risk (one day) for females 13-49 years of age, a rabbit developmental toxicity study with a NOAEL of 150 mg/kg bw/day was selected for risk assessment. An increased incidence of cardiovascular malformations was observed at 450 mg/kg bw/day. Standard uncertainty factors of 10-fold for interspecies extrapolation and 10-fold for intraspecies variability were applied. The *Pest Control Products Act* factor was reduced to three-fold for the reasons outlined in the *Pest Control Products Act* Hazard Characterization section. Therefore, the composite assessment factor (CAF) is 300.

The ARfD is calculated according to the following formula:

$$\textbf{ARfD} = \frac{\textbf{NOAEL}}{\textbf{CAF}} = \frac{\textbf{150 mg/kg bw/day}}{\textbf{300}} = \textbf{0.5 mg/kg bw of glyphosate}$$

3.2.2 Acute Dietary Exposure and Risk Assessment

The acute dietary risk was calculated considering the highest ingestion of glyphosate that would be likely on any one day, and using food consumption and food residue values. The expected intake of residues is compared to the ARfD, which is the dose at which an individual could be exposed on any given day and expect no adverse health effects. When the expected intake of residues is less than the ARfD, then acute dietary exposure is not of concern.

The acute dietary exposure assessments were conducted for the acid form of glyphosate (including all the metabolites comprised in the residue definition), which is considered to be the common moiety for all currently registered forms of glyphosate.

Following the PMRA’s tiered approach, basic (in other words, upperbound) exposure assessments were performed for females 13-49 years old and all other population subgroups by using MRL/tolerance-level residues for all commodities, default processing factors and assuming that all crops were 100% treated. Canadian MRLs, United States tolerances or Codex MRLs, whichever was greater, were used for all crops, including imports. Drinking water contribution to the exposure was accounted for by direct incorporation of the appropriately estimated environmental concentration (EEC), obtained from water modelling (see Section 3.3.1), into the dietary exposure evaluation model.

The acute exposure estimate at the 95^{th} percentile for females 13-49 years old is 31% of the ARfD and therefore is not of concern. Acute exposure estimates at the 95^{th} percentile for population subgroups other than females 13-49 years old range from 12% to 45% of the ARfD and therefore are also not of concern.

3.2.3 Determination of Acceptable Daily Intake

To estimate dietary risk of long-term exposure, the 26-month chronic toxicity and carcinogenicity study in rats with a NOAEL of 32/34 mg/kg bw/day was selected for risk assessment. No treatment-related effects were noted in this study. This was the highest (combined) NOAEL for the long-term toxicity studies in rats. The lowest (combined) LOAEL was 100 mg/kg bw/day, based on reduction in body weight in male rats in the interim sacrifice and increased incidences and severity of cellular alterations in the parotid and submandibular glands in a 24-month chronic toxicity and carcinogenicity study in rats. These NOAELs/LOAELs were further supported by the NOAEL of 30 and the lowest observed adverse effect level (LOAEL) of 100 mg/kg bw/day in one-year studies in dogs. Standard uncertainty factors of 10-fold for interspecies extrapolation and 10-fold for intra-species variability were applied. The *Pest Control Products Act* was reduced to one-fold for the reasons outlined in the *Pest Control Products Act* Hazard Characterization section. Therefore, the CAF is 100.

The ADI is calculated according to following formula:

$$\textbf{ADI} = \frac{\textbf{NOAEL}}{\textbf{CAF}} = \frac{\textbf{32 mg/kg bw/day}}{\textbf{100}} = \textbf{0.3 mg/kg bw/day of glyphosate}$$

This ADI provides a margin of 500 to the NOAEL of 150 mg/kg bw/day for the fetal cardiovascular malformations in the rabbit developmental toxicity study.

3.2.4 Chronic Dietary Exposure and Risk Assessment

The chronic dietary risk was calculated by using the average consumption of different foods and the average residue values on those foods. This expected intake of residues was then compared to the ADI. When the expected intake of residues is less than the ADI, then chronic dietary exposure is not of concern.

The chronic dietary exposure assessments were conducted for the acid form of glyphosate (including all the metabolites comprised in the residue definition), which is considered to be the common moiety for all currently registered forms of glyphosate.

Following the PMRA’s tiered approach, basic (in other words, upperbound) exposure assessments were performed for the general population and all population subgroups by using MRL/tolerance-level residues for all commodities, default processing factors and assuming that all crops were 100% treated. Canadian MRLs, US tolerances or Codex MRLs, whichever was greater, were used for all crops, including imports. Drinking water contribution to the exposure was accounted for by direct incorporation of the appropriate EEC, obtained from water modelling (see Section 3.3.1), into the dietary exposure evaluation model.

The chronic exposure estimate for the general population is 30% of the ADI and, therefore, is not of concern. Exposure estimates for population subgroups range from 20% to 70% of the ADI and, therefore, are not of concern.

3.3 Exposure from Drinking Water

Residues of glyphosate and its metabolite aminomethylphosphonic acid (AMPA) in potential drinking water sources were estimated from modelling.

3.3.1 Concentrations in Drinking Water

Drinking water EECs of combined residues of glyphosate and its transformation product AMPA in potential sources of drinking water were calculated using PRZM/EXAMS models for a small reservoir. EECs in groundwater were not calculated as leaching to groundwater was not detected. Most scenarios were run using 50-year weather data. Level 2 (refined) surface water modelling was carried out with nine scenarios across Canada to reflect typical crop uses, application rates and timing and application methods. The highest surface water reservoir daily peak EEC value of 0.267 ppm and yearly average EEC value of 0.197 ppm for combined residues of glyphosate and AMPA (please refer to Appendix XI, Table XI.7) were used in the acute and the chronic dietary exposure assessments, respectively.

3.3.2 Drinking Water Exposure and Risk Assessment

Drinking water exposure estimates were combined with food exposure estimates, with EEC point estimates incorporated directly in the dietary (food + drinking water) assessments. Please refer to Sections 3.2.2 and 3.2.4 for details.

3.4 Occupational and Non-Occupational Exposure and Risk Assessment

For the purpose of this assessment, information was summarized for glyphosate and each of the five salt forms. This integration of information was based on the fact that the majority of use patterns among the salt forms are similar and that although variations exist in terms of the range of use sites and rates of applications, these differences are limited.

Occupational and non-occupational risk is estimated by comparing potential exposures with the most relevant endpoint from toxicology studies to calculate a margin of exposure (MOE). This is compared to a target MOE incorporating uncertainty factors protective of the most sensitive subpopulation. If the calculated MOE is less than the target MOE, it does not necessarily mean that exposure will result in adverse effects, but mitigation measures to reduce risk would be required.

3.4.1 Toxicology Endpoint Selection for Occupational and Non-Occupational Risk Assessment

Incidental Oral, Short-term Dermal and Inhalation Routes

For **incidental oral and occupational/bystander risk assessments for short-term dermal and inhalation routes**, a 90-day oral study in rats was selected. A NOAEL was not established in this study. The LOAEL was 30 mg/kg bw/day based on an increased incidence and severity of cellular alteration in the parotid gland. This LOAEL was considered to be at the threshold of toxicological adversity due to the mild nature of the cellular alteration in the parotid glands at this dose level. As a result, an uncertainty factor (UF_L) for extrapolating from a LOAEL to a NOAEL was not deemed necessary. Standard uncertainty factors of 10-fold for interspecies extrapolation and 10-fold for intraspecies variability were applied. Therefore, the target **Margin of Exposure (MOE) is 100**.

Intermediate- and Long-term Dermal and Inhalation Routes

For **occupational/bystander risk assessments for intermediate- and long-term and dermal and inhalation routes**, the 26-month chronic toxicity and carcinogenicity study in rats with a NOAEL of 32/34 mg/kg bw/day was selected for risk assessment. No treatment-related effects were noted in this study. This was the highest (combined) NOAEL for the long-term toxicity studies in rats. The lowest (combined) LOAEL was 100 mg/kg bw/day based on reduction in body weight in male rats in the interim sacrifice and increased incidences and severity of cellular alterations in the parotid and submandibular glands in a 24-month chronic toxicity and carcinogenicity study in rats. These NOAELS/LOAELS were further supported by the NOAEL of 30 and LOAEL of 100 mg/kg bw/day in one-year studies in dogs. Standard uncertainty factors of 10-fold for interspecies extrapolation and 10-fold for intraspecies variability were applied. Therefore, the target **Margin of Exposure (MOE) is 100**.

Dermal Absorption

Based on a chemical-specific in vivo dermal absorption study, a dermal absorption factor of 4% was determined for the exposure assessment of glyphosate.

3.4.2 Occupational Exposure and Risk Assessment

Workers can be exposed to glyphosate through mixing, loading, or applying the pesticide, and when entering a treated site to conduct activities such as scouting.

Mixer, Loader, and Applicator Exposure and Risk Assessment

There are potential exposures to mixers, loaders and applicators. The following scenarios were assessed:

- Mixing/loading liquids.
- Liquid groundboom, aerial, airblast, mechanically pressurized handgun, backpack, roller, wick and other wiper implements, cut stump, right-of-way (ROW) sprayer, and injection application to trees.
- Injection application of pastes (pre-loaded cartridges) to trees.

Based on the number of applications and the timing of application, workers applying glyphosate would generally have a short (< 30 days) duration of exposure. Custom applicators may also have intermediate-term (in other words, up to several months) exposure for those crops with multiple applications. Injection applications to trees can occur year-round (except when the barks of trees are frozen), so exposure in these scenarios can be long-term.

Handler exposure was estimated based on the following personal protection**:**

Baseline PPE:	Long sleeved shirt, long pants and chemical-resistant gloves (unless otherwise specified). For groundboom application, this scenario does not include gloves as the data quality was better for non-gloved scenarios than gloved scenarios.

Dermal and inhalation exposures were estimated using data from the *Pesticide Handlers Exposure Database* (PHED), *Version 1.1*. The PHED is a compilation of generic mixer/loader applicator passive dosimetry data with associated software that facilitates the generation of scenario-specific exposure estimates based on formulation type, application equipment, mix/load systems and level of personal protective equipment (PPE).

Glyphosate is registered for cut stump applications for which no PHED scenario exists. It was assumed that exposure from mixing/loading and applying glyphosate by a manually pressurized handwand would be comparable to the squirt bottle method used for cut stump applications.

Glyphosate is registered for tree injection applications for which no PHED scenario exists. For this scenario, the mixing and loading (liquid) scenario was used to estimate exposure of preparing the solution and loading the cartridges. Applicator exposure is expected to be minimal as activities are conducted in a closed system. It was assumed that this scenario would be protective of the preloaded paste cartridges scenario, as exposure during mixing and loading the liquid solution would be higher.

Glyphosate is not applied by hose-end spray or low-pressure nozzle gun sprayer connected to a truck. Therefore, these application equipment types were not assessed in the applicator risk assessment.

Mixer/loader/applicator exposure estimates are based on the best available data at this time. Route-specific MOEs for mixer/loader and applicators for agricultural crops, commercial and recreational areas are outlined in Appendix VII, Tables 1 and 2. Calculated dermal, inhalation, and combined (total exposure from dermal and inhalation routes) MOEs for mixer/loaders and applicators of glyphosate exceeded target MOEs for all uses and are not of concern.

Postapplication Worker Exposure and Risk Assessment

The postapplication occupational risk assessment considered exposures to workers who enter treated sites to conduct agronomic activities involving foliar contact (for example, scouting). Based on the glyphosate use pattern, there is potential for short-term (< 30 days) postapplication exposure to glyphosate residues for workers.

Activity-specific transfer coefficients (TCs) from the Agricultural Re-entry Task Force (ARTF) were used to estimate postapplication exposure resulting from contact with treated turf and foliage at various times after application. A TC is a factor that relates worker exposure to dislodgeable residues. TCs are specific to a given crop and activity combination (for example, hand harvesting apples, scouting late season corn) and reflect standard clothing worn by adult workers. Postapplication exposure activities include (but are not limited to): scouting, weeding, and transplanting.

As glyphosate is a non-selective herbicide, applications are usually made in the dormant season or prior to planting. If application is required when the crop is developing, sprays are directed between rows, and shields, wipers and rollers are used to prevent crop damage. In this case, it is unlikely that there will be significant residues on the foliage of these crops to which workers could come into contact when performing various postapplication activities. However, some activities, such as scouting and irrigation, may result in contact with treated foliage. Therefore, these postapplication activities were assessed.

Dislodgeable foliar residue (DFR) and turf transferrable residues (TTR) refer to the amount of residue that can be dislodged or transferred from a surface, such as the leaves of a plant or turf. There were no chemical-specific DFR or TTR studies submitted to the PMRA for the re-evaluation of glyphosate; therefore the following defaults were used:

- A default peak value of 25% of the application rate with a dissipation rate of 10% per day was used for DFR.
- A default peak value of 1% of the application rate with a dissipation rate of 10% per day was used for TTR.

For workers entering a treated site, restricted entry intervals (REIs) are calculated to determine the minimum length of time required before people can safely enter after application. An REI is the duration of time that must elapse before residues decline to a level where performance of a specific activity results in exposures above the target MOE.

The PMRA is primarily concerned with the potential for dermal exposure for workers performing postapplication activities in crops treated with a foliar spray. Based on the vapour pressure of glyphosate, inhalation exposure is not likely to be of concern provided that the minimum 12-hour REI is followed.

Calculated dermal MOEs for worker postapplication exposure to glyphosate in commercial crops exceeded target MOEs and are not of concern. REIs were set at the standard minimum value of 12 hours for all postapplication activities. The postapplication exposure assessment is outlined in Appendix VII, Table 3.

3.4.3 Non-Occupational Exposure and Risk Assessment

Non-occupational risk assessment involves estimating risks to the general population, including youth and children, during or after pesticide application.

The United States Environmental Protection Agency (USEPA) has generated standard default assumptions for developing residential exposure assessments for both applicator and postapplication exposures when chemical- and/or site-specific field data are limited. These assumptions may be used in the absence of, or as a supplement to, chemical- and/or site-specific data and generally result in high-end estimates of exposure. These assumptions are outlined in the Standard Operating Procedures (SOPs) for Residential Pesticide Exposure Assessments (2012). The following sections from the Residential SOPs were used to assess residential exposure to glyphosate:

- Section 3: Lawns and Turf
- Section 4: Gardens and Trees

Residential Handler Exposure and Risk Assessment

A residential applicator would be an adult who purchased a domestic-class glyphosate product for outdoor residential use.

Residential applicators are assumed to be wearing shorts, short-sleeved shirts, shoes and socks. Based on label directions, domestic-class glyphosate products are assumed to be applied two times per year (with a seven-day interval); therefore they would have potential for short-term (1-30 days) exposure during application to lawns or turf.

Domestic-class glyphosate products are available in both liquid and tablet (water soluble) formulations. For tablet formulations, the label instructs the handler to open the tablet packages and, without touching the tablets, drop them directly into water to dissolve. This would result in minimal handler exposure to the tablet itself. Thus, the tablet formulation was not assessed separately, as it was assumed that the risk assessment for the liquid formulation, which has a higher level of exposure, would be protective of exposure from the tablet formulation.

Based on the typical use pattern, the major scenarios identified were:

- mixing and loading liquids
- mixing and loading of water soluble tablets
- manually pressurized handwand, backpack and sprinkler (liquid) application to lawns and turf and gardens and trees
- ready-to-use sprayer application to lawns and turf, and gardens and trees

Calculated dermal, inhalation, and combined (total exposure from dermal and inhalation routes) MOEs for residential handler exposure to glyphosate exceeded target MOEs and are not of concern. The residential handler risk assessment is outlined in Appendix VIII, Table 1.

Residential Postapplication Exposure and Risk Assessment

Residential postapplication exposure refers to an exposure scenario in which an individual is exposed through dermal, inhalation, and/or incidental oral (non-dietary ingestion) routes as a result of being in a residential environment that has been previously treated with a pesticide. The area could have been treated by a residential applicator using a domestic-class product or a commercial applicator hired to treat the residential area.

There is potential for short-term exposure to adults, youth (11 to < 16 years old), and children (6 to < 11 years old and 1 to < 2 years old) through contact with transferable residues following commercial applications of glyphosate to turf, as well as following domestic applications of glyphosate to lawns and turf. Adults, youth and children have the potential for postapplication dermal exposure; children (1 to < 2 years old) also have the potential for incidental oral exposure. As the use rate of domestic class products is greater than the commercial use rate for residential settings, the postapplication assessment for products applied by a residential applicator is protective of the postapplication exposure to homeowners, youth and children after a commercial application of glyphosate to turf.

The following scenarios were assessed for the postapplication exposure to glyphosate:

- Lawns and Turf
    - Adults, youth, and children (1 to < 2 years old) dermal exposure resulting from activities on turf
    - Adult and youth dermal exposure resulting from mowing
    - Adult, youth and children (6 to < 11 years old) dermal exposure resulting from golfing
    - Children (1 to < 2 years old) incidental oral exposure

As per label directions, glyphosate can be applied twice per year (with a seven-day interval). This assumption was taken into consideration when determining postapplication risk.

The PMRA is primarily concerned with the potential for dermal exposure for homeowners performing postapplication activities in treated residential areas. Non-dietary ingestion of soil was not assessed as glyphosate becomes inactive once in the soil.

Postapplication dermal exposure using activity-specific TCs was calculated using estimates for foliar residue, leaf-to-skin residue transfer for individuals contacting treated foliage during certain activities, and exposure time. A TC is a factor that relates exposure to dislodgeable residues. It is the amount of treated surface that a person contacts while performing activities in a given period (usually expressed in units of cm^2 per hour) and is specific to a particular population.

For the residential postapplication assessment of glyphosate, transfer coefficients were derived in the Residential SOPs for activities conducted on turf, such as mowing and golfing.

Calculated dermal MOEs for residential postapplication exposure, golf and incidental oral exposure to glyphosate exceeded target MOEs and are not of concern. The residential postapplication risk assessment is outlined in Appendix VIII, Tables 2-5.

Exposure to homeowners who apply glyphosate and conduct postapplication activities in treated areas, along with potential dietary exposure, are considered in Section 3.5 – Aggregate Exposure and Risk Assessment.

Dermal Bystander Exposure and Risk Assessment

There is potential for short-term exposure to glyphosate for adults, youth (11 to < 16 years old) and children (6 to < 11 years old) by entry into treated non-cropland areas (in other words, hiking through forests or parks that have recently been treated with glyphosate).

Calculated dermal MOEs for bystander exposure to glyphosate exceeded target MOEs and are not of concern. Bystander exposure is outlined in Appendix VIII, Table 6.

3.5 Aggregate Exposure and Risk Assessment

Aggregate exposure is the total exposure to a single pesticide that may occur from food, drinking water, residential and other non-occupational sources, and from all known or plausible exposure routes (oral, dermal and inhalation).

3.5.1 Toxicology Endpoint Selection for Aggregate Risk Assessment

For **aggregate risk assessment (all durations)**, the selected toxicological endpoint was the effect on salivary glands. Salivary glands were not examined in the dermal toxicity studies and a short-term inhalation study was not available. Effects on salivary glands could potentially result from exposure to glyphosate via inhalation or dermal routes, similar to the effects observed following oral exposure to glyphosate. Therefore, the most relevant study was the 26-month chronic toxicity and carcinogenicity study in rats with a NOAEL of 32/34 mg/kg bw/day. This was the highest (combined) NOAEL for the long-term toxicity studies in rats.

The lowest (combined) LOAEL was 100 mg/kg bw/day based on reduction in body weight in male rats in the interim sacrifice and increased incidences and severity of cellular alterations in the parotid and submandibular glands in a 24-month chronic toxicity and carcinogenicity study in rats. Standard uncertainty factors of 10-fold for interspecies extrapolation and 10-fold for intraspecies variability were applied. Therefore, the target **Margin of Exposure (MOE) is 100**.

3.5.2 Residential and Non-Occupational Aggregate Exposure and Risk Assessment

In an aggregate risk assessment, the combined potential risk associated with food, drinking water and various residential exposure pathways is assessed. A major consideration is the likelihood of co-occurences of exposure.

For glyphosate, the following scenarios that were expected to co-occur are:

- Inhalation and dermal exposure to homeowners (adults) applying glyphosate to lawns/turf + postapplication dermal exposure (adults) performing activities in treated areas + chronic dietary (food and drinking water).
- Postapplication dermal exposure (youth and children [6 to < 11 years old]) from performing postapplication activities in treated lawns/turf + chronic dietary (food and drinking water).
- Postapplication dermal exposure (children 1 to < 2 years old) + incidental oral exposure (hand-to-mouth) from performing postapplication activities in treated lawns/turf + chronic dietary (food and drinking water).

When conducting the aggregate exposure assessment, two applications (with a seven-day interval) at the highest rate were assumed. All calculated MOEs reached the target MOE except for the children (1 to < 2 years old) for the postapplication + incidental oral exposure + chronic dietary scenario. Therefore, dietary and non-dietary exposure refinements were required.

The dietary exposure assessment used United States Tolerances or Codex MRLs whenever they happened to be greater than Canadian MRLs. However, domestic production and import statistics indicated that barley, oats and wheat consumed in Canada are almost totally produced in Canada (> 99%), with < 1% imported. Thus it was considered reasonable to use Canadian MRLs for these crops as a refinement in the calculation of the chronic dietary exposure estimates for the purpose of aggregation with residential exposure only, rather than the United States and Codex group tolerance of 30 ppm. The current Canadian MRLs in these cereal crops are as follows: barley (and barley flour) – 10 ppm, barley milling fractions (except flour) – 15 ppm, oat (and oat flour) – 15 ppm, oat milling fractions (except flour) – 35 ppm, wheat (and wheat flour) – 5 ppm, and wheat milling fraction (except flour) **–** 15 ppm.

In addition, assuming two applications (with a seven-day interval) at the maximum application rate is a highly conservative exposure assumption, as it is unlikely that children would be exposed to turf residues of the highest rate, at the lowest interval of application immediately after application. Therefore, a refinement using one application of glyphosate along with a seven-day time-weighted TTR average was used (the average resides of glyphosate were calculated over a seven-day span) for the entire aggregate assessment for all populations.

Using these refinements, all calculated MOEs exceeded the target MOE and are not of concern. The aggregate exposure estimates from residential scenarios are presented in Appendix IX, Table 1.

3.6 Polyethoxylated Tallow Amines

Polyethoxylated tallow amines (POEA) is a family of several compounds that are used as surfactants in many glyphosate products registered in Canada. In 2010, the USEPA completed a human health risk assessment for phosphate ester, tallowamine, ethoxylated (ATAE), which is a subfamily of POEA (PMRA #2439855). The USEPA currently uses this assessment as the basis for the approval of POEA. The USEPA assessment is considered to be applicable to the Canadian exposure profile and can be relied upon by PMRA to evaluate POEA risks. This assessment was considered acceptable by the PMRA.

The USEPA ATAE assessment was based on very conservative assumptions (for example, all crops treated at 100%, highest application rates and default values). Since exposures from all pesticidal sources of POEA need to be considered, the potential occupational, non-occupational and aggregate exposures from 57 highly used herbicides, fungicides and insecticides were evaluated. Given this approach, the POEA risk assessment and conclusions apply broadly to all pesticide products.

No risks of concern were identified, provided end-use products contained no more than 20% POEA by weight. All of the currently registered glyphosate end-use products in Canada meet this limit.

In addition, no new toxicity data relevant to the hazard assessment of POEA were found following a search of the published scientific literature beyond that identified in the USEPA ATAE health risk assessment. As such, an updated risk assessment was not required.

3.7 Incident Reports Related to Human Health

Since 26 April 2007, registrants have been legally required to report incidents to the PMRA that include adverse effects to the health of Canadians and to the environment. Information about the reporting of pesticide incidents can be found on the PMRA website. Incident reports were searched and reviewed for the active ingredient glyphosate. As of January 2014, the PMRA had received 71 human and 167 domestic animal incident reports involving glyphosate.

A total of 75 individuals were affected in the human incidents. In almost half of these incidents, the described effects were considered to be associated with the reported pesticide exposure. Major incident reports involving glyphosate occurred mainly in the United States as a result of accidental ingestion. Other highly acutely toxic active ingredients (such as diquat and paraquat) were also noted in these incidents. Therefore, any adverse effects could not be attributed specifically to glyphosate. Non-serious incidents, which included a prevalence of eye and skin irritation effects, occurred as a result of activities associated with application. Commercial class products were frequently identified in these incidents.

The domestic animal incidents involving glyphosate were mostly animal deaths that occurred in the United States. Overall, the reported symptoms in animals were clinical signs of toxicity such as vomiting. Contact with a treated area and ingestion of vegetation treated with a product containing glyphosate were commonly noted as activities leading to exposure in animal incidents.

No label changes resulting from these incident reports are considered necessary at this time.

4.0 Impact on the Environment

The environmental assessment was conducted based on data and information from registrants as well as from other regulatory agencies. Additional relevant data from published and unpublished scientific literature and monitoring data from federal and provincial governments were also considered.

4.1 Fate and Behaviour in the Environment

The fate and behaviour data for glyphosate and its transformation products in terrestrial and aquatic environments are presented in Appendix X, Tables X.1 and X.2.

Glyphosate enters the terrestrial environment when it is used as a herbicide in agriculture, forestry (site preparation) and non-cropland (right of ways and industrial sites). In the terrestrial environment, glyphosate is expected to be non-persistent to moderately persistent in aerobic soil (DT_{50} 1.9-151 d), producing the major soil biotransformation product AMPA. Under anaerobic conditions (flooded soil), glyphosate is more readily bound to soil and less readily transformed. Phototransformation is not expected to be an important route of dissipation.

Glyphosate has a low vapour pressure (1.3×10^{-7} Pa at 25ºC) and a low Henry’s law constant (2.1×10^{-9} Pa m^3) and is not expected to volatilize under field conditions from water or moist soil. Glyphosate is very soluble in water (12 000 mg a.e./L). Under Canadian field conditions (agriculture and forestry), glyphosate generally remains in the upper soil horizons and is considered to be non-persistent to moderately persistent (DT_{50} ranging from 6 to 82 days). Adsorption/desorption studies, soil column leaching studies, soil thin layer chromatography (TLC) studies, ground water modelling, as well the criteria of Cohen et al. (1984) and the groundwater ubiquity score (GUS) all indicate that glyphosate has low mobility in soil, remains in the upper soil horizon and has a low potential to leach to groundwater. Detection of glyphosate in lower structured soil horizons (loams and clay loams) by several researchers is believed to be the result of preferential flow through macropores. Glyphosate is rarely detected in known drinking water sources and groundwater in Canada, further supporting the conclusion that glyphosate is unlikely to contaminate groundwater. In terrestrial environments, AMPA is produced mainly through soil biotransformation and is non-persistent to moderately persistent (DT_{50} 2.1 to 107 days).

Glyphosate can enter aquatic environments through spray drift and runoff from the application site. Aerobic aquatic studies indicate that glyphosate dissipates rapidly from the water phase and partitions to sediment where transformation occurs more slowly (whole system DT_{50} 7.1 to 135 days). AMPA is the major transformation product produced. Hydrolysis (DT_{50} at 25ºC and pH 7 was estimated to be >162 days) and aquatic phototransformation (DT_{50} 69 to 413 days at pH 7) of glyphosate are not important routes of dissipation. Under anaerobic conditions, glyphosate was non-persistent to persistent (DT_{50} 7 to 208 days).

In aerobic aquatic environments, AMPA is found in both water and sediment and is non-persistent to moderately persistent (total system DT_{50} 10 to 83.4 days). In the water column, AMPA partitions to the sediment where it is further transformed to CO_2.

The surfactant POEA is expected to be non-volatile, non-persistent in soil and water and immobile in soil and sediment. It is not likely to leach to groundwater due to rapid microbial transformation and strong adsorption to soil particles.

Glyphosate and AMPA are not expected to bioaccumulate in aquatic and terrestrial organisms due to their low octanol-water partition coefficients. Certain surfactants found in glyphosate formulations, that are derived from POEA compounds (mixture of 100 discrete tertiary amine molecules) may have the potential for bioaccumulation. However, given that the components of these compounds are easily broken down and that they are not persistent in soil and water, significant bioaccumulation under field conditions is unlikely.

4.2 Environmental Risk Characterization

The environmental risk assessment integrates the environmental exposure and ecotoxicology information to estimate the potential for adverse effects on non-target species. This integration is achieved by comparing exposure concentrations with concentrations at which adverse effects occur. EECs are concentrations of pesticide in various environmental media, such as food, water, soil and air. The EECs are estimated using standard models which take into consideration the application rate(s), chemical properties and environmental fate properties, including the dissipation of the pesticide between applications. EECs are presented in Appendix X, Tables X.3 to X.7. Ecotoxicology information includes acute and chronic toxicity data for various organisms or groups of organisms from both terrestrial and aquatic habitats including invertebrates, vertebrates and plants. Toxicity endpoints used in risk assessments may be adjusted to account for potential differences in species sensitivity as well as varying protection goals (in other words, protection at the community, population, or individual level). Summaries of toxicity data for both terrestrial and aquatic non-target organisms to glyphosate are presented in Appendix X, Tables X.8 to X.16.

Initially, a screening level risk assessment is performed to identify pesticides and/or specific uses that do not pose a risk to non-target organisms, and to identify those groups of organisms for which there may be a potential risk. The screening level risk assessment uses simple methods, conservative exposure scenarios (for example, direct application at a maximum cumulative application rate) and sensitive toxicity endpoints. A risk quotient (RQ) is calculated by dividing the exposure estimate by an appropriate toxicity value (RQ = exposure/toxicity), and the risk quotient is then compared to the level of concern (LOC). If the screening level risk quotient is below the level of concern, the risk is considered negligible and no further risk characterization is necessary. If the screening level risk quotient is equal to or greater than the level of concern, then a refined risk assessment is performed to further characterize the risk. A refined assessment takes into consideration more realistic exposure scenarios (such as drift to non-target habitats) and might consider different toxicity endpoints. Refinements may include further characterization of risk based on exposure modelling, monitoring data (Appendix XI), results from field or mesocosm studies, and probabilistic risk assessment methods. Refinements to the risk assessment may continue until the risk is adequately characterized or no further refinements are possible. Data derived from monitoring studies may also be used in refining a risk assessment.

Where possible the analysis of toxicity data also includes the determination of the hazardous concentration to five percent of species (HC_5) from species sensitivity distributions (SSDs) or determination of the most sensitive endpoint in each taxonomic group and category. The HC_5 is calculated for acute and chronic data sets using the LC_{50}/EC_{50} values and no observed effect concentration (NOEC) values as appropriate (EC_{25} was also used for terrestrial plants when no other data was available). The HC_5 is the concentration that is assumed to be protective for ninety-five percent of species of the assessed taxonomic group or assemblage as related to the assessment endpoint and ecological protection goal. At an EEC equal to the HC_5, ninety-five percent of all species (within each taxonomic group) are not expected to be exposed to concentrations exceeding their threshold toxicity value (for example, LC_{50}, NOEC).

The software program ETX 2.0 was used with a log-logistic model to generate SSDs where sufficient toxicity endpoints were available for different taxa, using all available relevant information on toxicity. This reduces the uncertainty in risk estimates and provides endpoints that are scientifically robust as compared to single species toxicity test endpoints, as well as returning endpoints that are more ecologically relevant as compared to relying on the most sensitive species available. Median HC_5 values are reported for SSDs and where possible are used to determine risk and mitigation measures. The variability in the data sets is indicated by the upper and lower bound HC_5 estimates and the confidence limit of the fraction of species affected, which indicates the minimum and maximum percent of species that could be affected when exposed to the HC_5 concentration.

Where an HC_5 value could not be determined due to insufficient species numbers or lack of model fit, etc., the most sensitive species endpoint was reported with the use of appropriate uncertainty factors. Where multiple data points are available for one species, a geometric mean was used to represent the sensitivity of the species. SSDs were determined for different glyphosate formulations, the transformation product AMPA and the formulant POEA for the following taxonomic groups (results are reported in Appendix X, Table X.17).

- Terrestrial plants
- Freshwater invertebrates, fish, algae, amphibians and aquatic plants
- Marine fish, invertebrates and algae

4.2.1 Risks to Terrestrial Organisms

Certain glyphosate formulations include the surfactant POEA, which has been shown to be toxic to aquatic organisms under laboratory conditions. For the environmental risk assessment, the technical grade active ingredient, transformation product AMPA, POEA and formulated end-use products were evaluated. Results for formulated end-use products were categorized into those products that contain POEA, those that do not and those for which information was not available to determine if they included POEA or not.

Summaries of the toxicity data considered in this review are presented in Appendix X, Tables X.8 to X.16. For the assessment of risk, toxicity endpoints chosen from the most sensitive species or obtained from the SSD were used as surrogates for the wide range of species that can be potentially exposed following treatment with glyphosate. The terrestrial assessment took into account the range of agricultural application rates that are registered for glyphosate, taking into consideration that there may be multiple applications of glyphosate in a single-use season.

All data sets were grouped by test material type including technical grade active ingredient (technical grade active ingredient, includes all forms of glyphosate actives), end-use products containing the surfactant POEA (EUP + POEA), end-use products that do not contain POEA (EUP NO POEA), POEA alone and the glyphosate transformation product AMPA. All toxicity values were normalized to acid equivalent (a.e.).

Terrestrial Invertebrates

Earthworms, Soil Beneficial Insects, Bees, Predators and Parasitic Arthropods

Acute and chronic studies indicate that glyphosate is not toxic to earthworms and the resulting risk quotients based on the maximum application rate indicate that glyphosate is not expected to pose a risk to earthworms (Appendix X, Table X.18). A risk to the soil beneficial arthropod *Folsomia candida* was observed at the screening level (from in-field treatment), but refinement of the risk assessment based on drift including a soil deposition factor and also on field studies from scientific publications (not reported in tables) indicated arthropod populations would recover from exposure to glyphosate applied at the maximum rate in apple orchards and canola fields (Appendix X, Table X.18).

Glyphosate is not acutely toxic (contact and oral) to adult bees and risk quotients indicate that glyphosate is not expected to pose a risk to adult bees (Appendix X, Table X.19). Chronic bee toxicity studies were not available for review; however, chronic effects are not expected based on the mode of action and the lack of effects in acute toxicity studies with adult bees (no sublethal effects or mortality at the highest test concentrations). Data on larval and brood toxicity were not available for review, however risks are not expected based on limited exposure (due to the mode of action of glyphosate), a lack of effects observed on adult bees and the lack of significant effects on other immature insects (chironomids and beneficial arthropods). This evidence, in combination with the absence of bee incident reports associated with the long history of use in Canada and foreign countries, indicates that glyphosate is unlikely to pose significant risks to honeybees for the proposed use pattern.

Under laboratory conditions, acute and chronic risks to predatory and parasitic arthropods were observed at the screening level (considering results from glass plate studies with both *Typhlodromus pyri* and *Aphidius rhopalosiphi*). Risk quotients also slightly exceeded the level of concern for *T. pyri* when considering results of extended laboratory conditions (leaf substrate) for apple, canola and potato uses (*T. pyri*, RQs = 1.9, 1.8 and 1.1 for apple, canola and potato uses, respectively). Refinement of the risk assessment and comparison with results obtained for other beneficial arthropods in recent scientific publications indicated that predator and parasitic arthropod populations would recover from exposure to glyphosate at the maximum rate of application in apple orchard and canola fields, respectively (7285 g a.e./ha and 6990 g a.e./ha) (Appendix X, Table X.19).

Risk to Birds

A tiered assessment of the risks to birds progressing from a conservative screening assessment to a more refined assessment was conducted. In the vast majority of studies, no toxic effects were reported. Consequently, a very conservative assessment was conducted using risk quotients generated using the highest concentration tested even though in all but one case, no toxic effects were observed. This assessment found only very small exceedences of the LOC and concluded that the risk to birds from acute oral, dietary and reproduction exposure to glyphosate and its formulations is expected to be low.

The screening level risk quotients based on acute oral exposure of birds to glyphosate technical may slightly exceed the level of concern for small- and medium-sized birds (RQ < 1.9 and < 1.5 for small- and medium-sized birds, respectively). However, this is based on the maximum concentration tested and no adverse effects were observed. The screening level risk quotients for reproduction also slightly exceed the level of concern for all sizes of birds (RQs range from 1.0 to 2.0) (Appendix X, Table X.20). Risks were further characterized by expanding the scope of the assessment to include other guilds, dietary exposure, mean residue levels and off-field exposure. Note that the acute oral LD_{50} and dietary LD_{50} values are greater than the highest doses tested, and the reproduction NOELs are the highest doses tested. Thus, the risk quotients are very conservative and may not reflect a true concern.

Based on the crop and the type of equipment used, spray drift factors were applied to the in-field exposure values to obtain off-field exposure values. The product label specifies that the spray droplets must be at least coarse, based on the American Society of Agricultural Engineers (ASAE) classification. Consistent with the use pattern for apples considered in this assessment, for a coarse droplet size, the maximum spray drift deposition at one metre downwind from the point of application is 3% of the rate for field sprayer application to agricultural crops. In the refined assessment, risk quotients slightly exceed the level of concern for on-field exposure of small and medium insectivorous birds on an acute, dietary and reproduction basis (maximum and mean residues), and large herbivores on a dietary and reproduction basis (maximum residues only) (Appendix X, Table X.21).

For these groups, the risk quotients exceed the level of concern by only a small margin and most are “less than” values, which means that the level of concern may not actually be exceeded. The risk quotients for off-field exposure do not exceed the level of concern. It should be noted that none of the toxicity studies conducted with technical glyphosate resulted in measured toxic effects in birds.

Screening-level estimated dietary exposure (EDE) values and RQ calculations for birds exposed to single applications of glyphosate formulations are presented in Appendix X, Table X.22. Based on acute oral exposure to glyphosate formulations, the screening level risk quotients exceed the level of concern for all sizes of birds (RQ = 1.6 to 3.1). The risk to birds from exposure to glyphosate formulations was further characterized by expanding the scope of the assessment to include other guilds, dietary exposure, mean residue levels as well as off-field exposure. In the refined risk assessment, for acute oral exposure of birds to glyphosate formulations, risk quotients exceed only the level of concern for small and medium insectivores (maximum residues RQ = 2.4 to 3.1, mean residue RQ = 1.7 to 2.2), and large herbivores (maximum residue RQ = 1.5 to 1.6) (Appendix X, Table 23). None of the dietary toxicity studies conducted with glyphosate formulations resulted in measured toxic effects in birds (the dietary LD_{50} values are greater than the highest doses tested), resulting in risk quotients for dietary exposure of birds to glyphosate formulations all having less than values (maximum residues RQ < 18.8 to < 0.7 and mean residues RQ < 13 to < 0.6) (Appendix X, Table X.23). The toxicity endpoints and associated risk quotients for dietary exposure are very conservative as they are based on an absence of effects.

Bird toxicity studies indicate that acute oral exposure (gavage) to glyphosate formulations can result in effects (and some risk quotients exceeding the level of concern). However, dietary studies, which are more representative of the potential route of exposure in the environment (in other words, through contaminated food items) reported that no toxic effects were observed with exposure to dried residues of the formulation in the diet. The predominant route of exposure will be from ingestion of dried residues on food items. It should be noted, however, that exposure to the sprayed formulation, which could occur via preening if birds are sprayed directly or through spray drift, was not considered in this assessment. Thus, more weight is given to conclusions of the dietary assessment than to the acute oral assessment. Therefore, the risk to birds from acute oral, dietary and reproduction exposure to glyphosate and its formulations is expected to be low. The absence of incident reports for birds related to the use of glyphosate supports this conclusion. Bird hazard statements are not required on glyphosate product labels.

Risk to Mammals

Toxic effects were reported in only a few of the available studies conducted with mammals and these effects were observed only at very high doses. A tiered assessment of the risks to mammals progressing from a conservative screening assessment to a more refined assessment was conducted. This assessment found only very small exceedences of the LOC and concluded that the risk to mammals from acute oral and reproduction exposure to glyphosate and its formulations is expected to be low.

Screening level risk quotients exceed the level of concern for all sizes of mammals for acute oral exposure to glyphosate technical (RQ = 2.2 to 4.2) but did not exceed the level of concern for reproduction (RQ ≤ 0.9) (Appendix X, Table X.20). The risk to mammals from exposure to glyphosate technical was further characterized by expanding the scope of the assessment to include other guilds, dietary exposure, mean residue levels, off-field exposure as well as other endpoints. Eighteen acute oral glyphosate technical toxicity studies were available for mammals. Whereas a few studies measured effects at high doses, the majority indicated LD_{50} values greater than the highest dose tested. Based on the most sensitive endpoint for acute oral exposure, the risk quotients exceed the level of concern for on-field exposure of small insectivorous mammals when considering maximum (RQ = 2.2) and mean (RQ = 1.5) residues, medium-sized insectivorous and herbivorous mammals when considering maximum and mean residues (maximum residue RQ = 1.9 to 4.2 and mean residue RQ = 1.3 to 1.5) and large-sized insectivorous and herbivorous mammals when considering maximum residues only (RQ = 1.0 to 2.3) (Appendix I, Table). No risk quotients exceed the level of concern for off-field exposure. Given the range of toxicity values available, risk quotients were also calculated using the least sensitive acute oral endpoint for mammals. Based on an acute oral LD_{50} of 5600 mg/kg bw, risk quotients very slightly exceed the level of concern for on-field exposure of medium-sized herbivorous mammals exposed to maximum residues of glyphosate (RQ = 1.2) (Appendix X, Table X.24).

Screening level acute oral exposure RQ values for glyphosate formulations exceed the level of concern for all sizes mammals (RQ = 5.7 to 11) (Appendix X, Table X.22). The risk to mammals from exposure to glyphosate formulations was further characterized by expanding the scope of the assessment to include other guilds, mean residue levels, off-field exposure as well as other endpoints. Fifty acute oral toxicity studies (based only on three distinct species) with glyphosate formulations were available for mammals. Eight of these studies measured effects at high doses, but the majority indicated LD_{50} values greater than the highest dose tested. Based on the most sensitive endpoint for acute oral exposure, the risk quotients exceed the level of concern for on field exposure of insectivorous and herbivorous mammals of all sizes (maximum residue RQ = 2.6 to 11, mean residue RQ = 1.2 to 3.9), and small and medium-sized frugivores (maximum residue RQ = 1.5 to 1.8) (Appendix I). Risk quotients for off-field exposure did not exceed the level of concern. Risk quotients were also calculated using the least sensitive acute oral endpoint. Based on an acute oral LD_{50} of > 4000 mg/kg bw, risk quotients do not exceed the level of concern for mammals of any size (RQs ≤ 0.5) (Appendix X, Table X.25).

Overall, available data indicate that risks to mammals following acute oral exposure to glyphosate and its formulations are low. If any, acute risks to mammals would be restricted to on-field exposure of only a few guilds (herbivores and perhaps insectivores). No reproductive risks to mammals are expected from the use of glyphosate. This conclusion is supported by the absence of incident reports for mammals related to the use of glyphosate. Mammalian hazard statements are not required on glyphosate product labels.

Risk to Non-target Terrestrial Plants

Glyphosate is a broad spectrum herbicide and as such toxicity to susceptible non-target plants is expected if exposed to sufficiently high concentration. The risk assessment for non-target terrestrial plants identified some areas of potential risk and consequently measures to minimize exposure to non-target plants are required.

Based on EECs equal to the maximum cumulative application rates for the uses on apples, canola, corn and potatoes and the toxicity endpoints selected for seedling emergence (the most sensitive EC_{50}) and vegetative vigour (the EC_{50} for formulation without POEA and HC_5 of SSDs for formulations with POEA), all screening level risk quotients exceed the level of concern (Appendix X, Table X.26). The most sensitive terrestrial plant endpoint is the EC_{50} value of 0.014 kg a.e./ha for the end-use product without POEA based on vegetative vigour. Cumulative application rates were calculated using a soil DT_{50} of 32.6 days for seedling emergence and a foliar DT_{50} of 14.4 days for vegetative vigour, to account for dissipation between applications. The risk to terrestrial vascular plants was further characterized by looking at off-field exposure from drift.

For an ASAE coarse droplet size, the maximum spray drift deposition at one metre downwind from the point of application is 3% of the application rate for field sprayer application to agricultural crops and 17% for aerial application. Aerial application is registered for use on canola (pre-harvest), but not on apples, corn or potatoes. Based on the risk quotients using the off-field EECs from drift, the level of concern for terrestrial vascular plants is not exceeded for seedling emergence, but is exceeded for vegetative vigour in all cases, except for the use of formulations without POEA on potatoes (Appendix X, Table X.26).

To protect non-target terrestrial vascular plants, spray buffer zones are required on glyphosate product labels, both those with and without the surfactant POEA (Appendix XII).

Transformation Product (AMPA)

Earthworms and birds were the only terrestrial organisms tested with the transformation product AMPA. The screening level risk quotients for acute and chronic exposure did not exceed the level of concern. Since AMPA is mainly formed in soils through biological processes, has a low log K_{ow} (-2.36 to -1.63) and binds tightly to soil particles, exposure and risk to mammals and foliage dwelling arthropods is expected to be negligible. To date, no ecotoxicological incidents have been reported concerning AMPA. As such no additional studies are required at this time.

Endocrine Disruption

The USEPA Endocrine Disruptor Screening Program (EDSP) is a scientific program to screen pesticides, other chemicals, and environmental contaminants for substances having the potential to affect the estrogen, androgen or thyroid hormone systems. Glyphosate was included in the second EDSP List. The PMRA will consider the results of these screening tests as they become available.

4.2.2 Risks to Aquatic Organisms

Glyphosate can enter water bodies and expose non-target aquatic organisms through runoff or via spray drift. The aquatic risk assessment was conducted following a tiered approach with a very conservative screening assessment followed by refinements if concerns were identified at the screening level. Overall there are few risks of concerns for aquatic organisms with the exception of aquatic plants and some marine invertebrates and these areas of concern were mainly identified with formulations containing the surfactant POEA.

Summaries of the aquatic toxicity data considered in this review are presented in Appendix X, Table 27. The most sensitive aquatic taxonomic group is freshwater plants and the acute HC_5 value is 0.003 mg a.e./L for the EUP + POEA formulation. The order of species sensitivity was determined to be: freshwater plants (0.003 mg a.e./L) > marine fish and invertebrates (0.1 mg a.e./L) > freshwater algae (0.12 mg a.e./L) > freshwater invertebrates (0.19 mg a.e./L) > marine algae (0.33 mg a.e./L) > freshwater fish (0.36 mg a.e./L), and amphibians (0.86 mg a.e./L) (Appendix X, Table X.17).

Screening level risk quotients for all freshwater organisms that were tested with end-use products containing POEA following acute and/or chronic exposures were all above the level of concern. All tested glyphosate formulations that do not contain POEA had risk quotients below the level of concern, except for freshwater algae. Saltwater invertebrates (acute exposure) and algae (chronic exposure) exposed to glyphosate formulation containing POEA had risk quotients above the level of concern. The surfactant POEA tested alone had risk quotients above the level of concern for freshwater and marine/estuarine invertebrates and freshwater fish, confirming the international scientific consensus that POEA added to glyphosate increases the environmental risk to these organisms.

The transformation product AMPA is not toxic to aquatic organisms.

Refined Risk Assessment for Aquatic Organisms and Potential Risk from Drift

The risk to aquatic organisms was further characterized by taking into consideration the concentrations of glyphosate that could be deposited in off-field aquatic habitats that are downwind and directly adjacent to the treated field through drift of spray. The spray drift data of Wolf and Caldwell (2001) was used to determine the maximum spray deposit into an aquatic habitat located one metre downwind from a treated field. Review of the labels for glyphosate containing end-use products indicate that the end-use products are applied by ground and aerial application methods. The maximum percentage of the applied spray that is expected to drift 1m downwind from the application site during spraying using field sprayer and aerial application methods is determined based on a coarse spray droplet size: field sprayer – 3%, aerial – 17%, respectively. Given the variation in percent drift off site for each of the application methods, the assessment of potential risk from drift was done using the maximum single application for potato (groundboom application: 4320 g a.e./ha) and the maximum cumulative application rate for canola (aerial application: 4320 + 4320 + 902 at 10-day intervals g a.e./ha). The EECs resulting from drift for these two crops cover the full range of EECs from drift anticipated from all application rates and application methods.

For freshwater snails, freshwater and saltwater fish and saltwater algae, the risk quotients, after refinement, were below the level of concern.

For freshwater invertebrates, the risk quotients derived for acute exposure to spray drift from the surfactant POEA alone exceeded the level of concern (RQ = 1.8 – 16.1). Based on acute toxicity endpoints (HC_5) derived for POEA containing glyphosate formulations, the level of concern is slightly exceeded at the highest cummulative aerial application rate (RQ = 1.1).

For freshwater plants and marine/estuarine invertebrates, the level of concern is exceeded for acute effects at all application rates and for all application methods (freshwater plants RQ = 6.7 to 67 and marine/estuarine invertebrate RQ = 2 to 20), with the risk quotients being based on the toxicity to glyphosate formulations that contain POEA. Based on glyphosate formulations that do not contain POEA, the level of concern for acute effects is exceeded for freshwater algae at the highest application rate (RQ = 3.3).

Based on amphibian laboratory toxicity data, the level of concern is slightly exceeded for amphibians exposed to spray drift from glyphosate formulations containing POEA at the highest cumulative aerial application rate on an acute and chronic basis (acute RQ = 1.1, chronic RQ = 1.2), however the level of concern for acute and chronic effects is not exceeded when amphibian toxicity data derived from field and mesocosm level studies are considered (Appendix X, Table X.28).

To protect aquatic species, spray buffer zones are required on glyphosate product labels, both those with and without the surfactant POEA.

Assessment of Potential Risk from Runoff

Aquatic organisms can also be exposed to glyphosate applied to foliage as a result of runoff into a body of water. The linked models Pesticide Root Zone Model (PRZM) and Exposure Analysis Modeling System (EXAMS) were used to predict EECs resulting from runoff of glyphosate following application. Considering the crop uses and geographic crop distribution, as well as the available scenarios, nine standard regional scenarios were modelled to represent different regions of Canada. The Level 1 glyphosate EECs in a 1-ha receiving water body (15 and 80 cm deep) predicted by PRZM-EXAMS for these crops applications are presented in Tables XI.3-5, Appendix XI. The values reported by PRZM/EXAMS are 90^{th} percentile concentrations of the concentrations determined at a number of time-frames including the yearly peak, 96-hr, 21-d, 60-d, 90-d and yearly average.

Acute and chronic risk quotient values were calculated using an EEC for the time frame that most closely matched the exposure time used to generate the endpoint. For example, a 96-hour LC_{50} would use the 96-hour value generated by the model; a 21-day NOEC would use the 21-day EEC value. At the screening level, RQ values for organisms (acute and/or chronic exposure) exceeded the level of concern. The EECs used for calculation of the RQs were the highest values for the appropriate depth and appropriate time frame (in other words, potato-use scenario in Prince Edward Island); when the RQ based on the highest EEC exceeded the level of concern, an

RQ based on the lowest EEC values (apple-use scenario in British Columbia) was also calculated. Screening level acute and chronic RQ values for freshwater and marine organisms are reported in Appendix X, Table X.27.

Refinement was done for runoff, with all endpoints being based on exposure to glyphosate formulations containing POEA, unless otherwise indicated.

The risk quotients for runoff derived for acute exposure exceed the level of concern for freshwater algae and marine invertebrates (freshwater algae RQ = 1.6, marine invertebrates RQ = 9.6) at the highest EECs (potato-use scenario in Prince Edward Island), but not at the lowest EECs (apple-use scenario in British Columbia). The risk quotients derived for chronic exposure indicate that the level of concern is exceeded for freshwater aquatic plants (RQ = 26) at the highest EECs (potato-use scenario in Prince Edward Island), but not at the lowest EECs (apple-use scenario in British Columbia) (Appendix X, Table X.29).

Refinement with Monitoring Data

The risk assessment was refined by considering all available Canadian monitoring data. A summary of water monitoring data is presented in Appendix XI. An EEC of 40.8 ug/L (the highest detection of glyphosate in surface water) was used for the refined risk assessment. Risk quotients were calculated for organisms (acute and/or chronic exposure) that showed exceedence of the level of concern at the screening level. The refined RQ values (Appendix X, Table X.30) indicate that the level of concern not exceeded for aquatic organisms with the exception of freshwater plants (RQ = 14).

Label statements are specified to help reduce runoff to aquatic habitats.

4.2.3 Incident Reports Related to the Environment

Since 26 April 2007, registrants have been required by law to report incidents to the PMRA that include adverse effects to Canadian health or the environment. Information about the reporting of pesticide incidents can be found on the PMRA website. Incident reports involving all forms of the active ingredient glyphosate were reviewed. As of 10 May 2013, there were 37 environmental incident reports in the PMRA database involving a form of the active ingredient glyphosate (PMRA# 2304789 and 2310009).

There were three major environmental incidents in which fish were killed when water used to douse a chemical warehouse fire was released into a stream. It was unclear which chemical may have been responsible for the fish mortality.

The remaining incidents were minor in nature and mostly involved grass damage following the direct application of a glyphosate product. There were six minor non-grass incidents that occurred following the drift of a glyphosate product onto non-target plants. Overall, there was a high degree of association between the reported environmental exposure to glyphosate and the effects observed.

Table 4.1 Minor Incidents Listed by Type of Organism Affected and Causality Level

Organism	Highly Probable	Probable	Possible	Unlikely	Total
Grass/Lawn	19	6	—	—	25
Herbaceous Plants	3	2	—	2	7
Trees or shrubs	1	2	1	—	4
Total	**23**	**10**	**1**	**2**	**36**[1]

[1] One incident reported damage to onions (herbaceous plant) and two different types of trees. The total count of incidents by organism type (36) is therefore higher than the number of minor incident reports received.

The USEPA Ecological Incident Information System (EIIS) was also queried for glyphosate incidents that were available in the database as of 29 November 2012. There were 633 incident reports available in the EIIS database that involved glyphosate (116 incidents), glyphosate isopropylamine salt (516 cases) or glyphosate potassium salt (1 case). The most frequently reported site/crop affected was agricultural area (139 incidents), cotton (51 incidents), corn (36 incidents), soybean (27 incidents), and home/lawn (26 incidents). Plant damage (449 cases) and mortality (171 cases) were the most frequently reported symptoms. Of the 633 reports, nearly half were considered to be related to the misuse of a product (48%) and 95% were considered to have a certainty of at least possible (180 possible, 352 probable and 42 highly probable). 54% of all reports were the result of drift, while 23% were treated directly.

All the information stated above was considered in this evaluation and did not affect the risk assessment.

5.0 Value

5.1 Value of Glyphosate

Glyphosate plays an important role in Canadian weed management in both agricultural production and non-agricultural land management and is the most widely used herbicide in Canada.

Value to Canadian Agriculture

Glyphosate is an important herbicide for Canadian agriculture:

- Due to its broad and flexible use pattern and its wide weed control spectrum, it is the most widely used herbicide in several major crops grown in Canada such as canola, soybean, field corn and wheat. It is also one of only a few herbicides regularly used in fruit orchards such as apple.
- It is the essential herbicide for use on the glyphosate tolerant crops (GTCs) including canola, soybean, corn, sweet corn and sugar beet. The combination of GTCs and glyphosate has been adopted as an important and common agricultural production practice in Canada.

- It is identified by growers (in the Canadian Grower Priority Database [version 22, August 2011]) as a priority for 17 new uses relating to 17 commodities: almond, bluegrass, kentucky bluegrass, bromegrass, canary seed, creeping red fescue, fescue, bermuda grass, pearl millet (grain), orchard grass, peanut, pecan, ryegrass, soybean, sunflower, timothy and wheatgrass.
- Among all herbicides registered, glyphosate has the broadest range of use sites because it can be used on all crops when applied prior to planting. In addition, it has the widest weed control spectrum including annual and perennial weeds, weedy trees and brush.
- Compared to other non-selective herbicides, it controls weeds of various sizes as well as the roots of these weeds since glyphosate is translocated throughout the plant.
- Glyphosate can be tank-mixed with many residual herbicides to broaden the weed spectrum and extend the duration of weed control thus decreasing the number of herbicide applications while maximizing yield and lowering fuel and energy consumption.
- Glyphosate has a wide application window including pre-seeding, after seeding (prior to crop emergence), in-crop, pre-harvest and post-harvest, allowing a flexible and effective weed management program:
    - When applied prior to seeding, application of it does not delay the seeding step due to its non-residual activity, therefore increasing flexibility for farming practices while providing a clean start for the new crop.
    - Glyphosate can also be applied in-crop as a postemergence treatment in conventional crops either as spot treatment or with wiper and wick application to control weeds taller than crops, which otherwise are impossible to control with other herbicides.
    - The pre-harvest application of glyphosate provides additional benefits to growers as it functions both as a harvest management and a desiccation treatment: equalizing the ripening or advancing the ripening process in uneven crops to achieve an earlier and more uniform harvest, lowering harvested grain seed moisture content, and increasing combine harvester efficiency. As compared to alternative crop desiccators such as diquat, glufosinate and carfentrazone, glyphosate also controls perennial weeds and can be used in a wider range of crops.
    - Post-harvest stubble treatment with glyphosate allows reduced or zero tillage, which has facilitated the adoption of conservation agriculture, where appropriate, thus reducing soil erosion, improving soil structure and retaining soil moisture as well as providing other benefits such as reduced tractor and fuel use.

Value to Non-agricultural Land Management

Glyphosate is also an important weed control tool in non-agricultural land management for these reasons:

- Due to its flexible use pattern and broad weed control spectrum, it is the most widely used herbicide in forestry. It can be applied at various stages in the forest regeneration cycle including site preparation, conifer release and stand thinning stages. Compared to alternative herbicides such as phenoxy, sulfonylnurea and triclopyr, glyphosate controls a wider range of weeds. Special application methods such as cut stump or injection treatment allow for year round application.
- It is also one of the widely used herbicides for pasture renovation, around structures on farms, amenity and industrial areas, and along rights-of-way.
- It is an effective tool for the control of many invasive weed species and for the control of toxic plants such as poison ivy.

For some speciality or minor use crops, glyphosate provides specific selective weed control techniques (weed wipers, shrouded sprayers and stem injection) where in many cases selective use of glyphosate is the only method of weed control possible or remaining in pasture and rangeland, vegetables, fruit crops and for the control of invasive weeds among desirable plants/trees.

Glyphosate has a unique mode of action and is the only molecule that is highly effective at inhibiting the enzyme EPSP of the shikimate pathway. It plays a role in delaying herbicide resistance development in weeds when used in rotation or combination with active ingredients from other herbicide site of action groups. However, the current Canadian agricultural production system relies heavily on glyphosate, resulting in more and more occurrences of glyphosate-resistant weeds. Kochia, Canada fleabane, giant ragweed and common ragweed are examples of such resistant weeds reported in Canada. These glyphosate-resistant weeds affect the efficacy and broader value of glyphosate. In order to prevent or delay the development of glyphosate-resistant weeds, it is crucial to maintain diversity in weed management practices.

5.2 Commercial Class Products

A total of 97 Commercial Class end-use products containing glyphosate were registered as of 3 May 2012. All Commercial Class glyphosate uses are supported by the registrant. As risk concerns identified can be mitigated, alternatives to the uses of glyphosate are not presented in this document.

5.3 Domestic Class Products

A total of 34 Domestic Class products containing glyphosate were currently registered as of 3 May 2012. All Domestic Class glyphosate uses are supported by the registrant. As risk concerns identified can be mitigated, alternatives to the uses of glyphosate are not presented in this document.

6.0 Pest Control Product Policy Considerations

6.1 Toxic Substances Management Policy Considerations

The Toxic Substances Management Policy (TSMP) is a federal government policy developed to provide direction on the management of substances of concern that are released into the environment. The TSMP calls for the virtual elimination of Track 1 substances, those that meet all four criteria outlined in the policy: in other words, persistent (in air, soil, water and/or sediment), bio-accumulative, primarily a result of human activity and toxic as defined by the *Canadian Environmental Protection Act*.

During the review process, glyphosate was assessed in accordance with the PMRA Regulatory Directive DIR99-03[3] and evaluated against the Track 1 criteria. The PMRA has reached the following conclusions:

- Glyphosate does not meet all Track 1 criteria and is not considered a Track 1 substance (see Table 6.1).
- Glyphosate does not form any transformation products that meet the Track 1 criteria.

The use of glyphosate is not expected to result in the entry of TSMP Track 1 substances into the environment.

[3] DIR99-03, *The Pest Management Regulatory Agency's Strategy for Implementing the Toxic Substances Management Policy*.

Table 6.1 Toxic Substances Management Policy Considerations – Comparisons to TSMP Track 1 Criteria

<table>
<tr><th>TSMP Track 1 Criteria</th><th colspan="2">TSMP Track 1 Criterion Value</th><th>Glyphosate
Are Criteria Met?</th></tr>
<tr><td>Toxic or toxic equivalent as defined by the Canadian Environmental Protection Act[1]</td><td colspan="2">Yes</td><td>Yes</td></tr>
<tr><td>Predominantly anthropogenic[2]</td><td colspan="2">Yes</td><td>Yes</td></tr>
<tr><td rowspan="4">Persistence[3]:</td><td>Soil</td><td>Half-life ≥ 182 days</td><td>No for aerobic soils: 15.3-142 days.
Some potential for anaerobic soils: 3-1699 days.</td></tr>
<tr><td>Water</td><td>Half-life ≥ 182 days</td><td>No: 1-5.4 days (water phase in aerobic system).</td></tr>
<tr><td>Sediment</td><td>Half-life ≥ 365 days</td><td>No: 26-58.1 days (sediment phase in aerobic system).</td></tr>
<tr><td>Air</td><td>Half-life ≥ 2 days or evidence of long range transport</td><td>Glyphosate has a low vapour pressure of 6.0×10^{-7} Pa at 20ºC (4.5×10^{-9} mm Hg) and according to the classification of Kennedy and Talbert (1977) is expected to be relatively non-volatile under field conditions. However, the Henry's law constant of 0.168 Pa m^3/mole (equivalent to 1.66×10^{-6} atm m^3/mole and a calculated $1/H = 3.38 \times 10^4$) indicates that glyphosate is slightly volatile from water surface or moist soil. The EFSA (2009) reported that glyphosate volatilization from water, soil and plant surfaces is expected to be low.</td></tr>
<tr><td rowspan="3">Bioaccumulation[4]</td><td colspan="2">Log $K_{ow} \geq 5$</td><td>Log K_{ow} = 4.1</td></tr>
<tr><td colspan="2">BCF ≥ 5000</td><td>BCF = 248-430</td></tr>
<tr><td colspan="2">BAF ≥ 5000</td><td>NA</td></tr>
<tr><td colspan="3">Is the chemical a TSMP Track 1 substance (all four criteria must be met)?</td><td>No, does not meet TSMP Track 1 criteria.</td></tr>
</table>

[1]All pesticides will be considered toxic or toxic equivalent for the purpose of initially assessing a pesticide against the TSMP criteria. Assessment of the toxicity criterion may be refined if required (in other words, all other TSMP criteria are met).
[2]The policy considers a substance "predominantly anthropogenic" if, based on expert judgement, its concentration in the environment medium is largely due to human activity, rather than to natural sources or releases.
[3] If the pesticide and/or the transformation product(s) meet one persistence criterion identified for one media (soil, water, sediment or air) than the criterion for persistence is considered to be met.
[4]Field data (for example, bioaccumulation factors [BAFs]) are preferred over laboratory data (for example, bioconcentration factors [BCFs]) which, in turn, are preferred over chemical properties (for example, log K_{ow}).

6.2 Formulants and Contaminants of Health or Environmental Concern

During the review process, contaminants in the technical product are compared against the list in the *Canada Gazette*.[4] The list is used as described in the PMRA Notice of Intent NOI2005-01[5] and is based on existing policies and regulations including: DIR99-03; and DIR2006-02[6], and taking into consideration the Ozone-depleting Substance Regulations, 1998, of the *Canadian Environmental Protection Act* (substances designated under the Montreal Protocol). The PMRA has reached the following conclusions:

- Based on the manufacturing process used, impurities of human health or environmental concern as identified in the *Canada Gazette*, Part II, Vol. 142, No. 13, SI/2008-67 (2008-06-25), including TSMP Track 1 substances, are not expected to be present in the glyphosate products.
- Technical grade Glyphosate and its end-use products do not contain any formulants or contaminants of health or environmental concern identified in the *Canada Gazette.*

The use of formulants in registered pest control products is assessed on an ongoing basis through PMRA formulant initiatives and Regulatory Directive DIR2006-02 (PMRA Formulants Policy).

7.0 Organisation for Economic Co-operation and Development Status of Glyphosate

Canada is part of the Organisation for Economic Co-operation and Development (OECD), which groups member countries and provides a forum in which governments can work together to share experiences and seek solutions to common problems.

As part of the re-evaluation of an active ingredient, the PMRA takes into consideration recent developments and new information on the status of an active ingredient in other jurisdictions, including OECD member countries. In particular, decisions by an OECD member country to prohibit all uses of an active ingredient for health or environmental reasons are considered for relevance to the Canadian situation.

Glyphosate is currently acceptable for use in other OECD countries, including the United States, Australia and the European Union. As of 17 March 2015, no decision by an OECD member country to prohibit all uses of glyphosate for health or environmental reasons has been identified.

6 DIR2006-02, *PMRA Formulants Policy*.

8.0 Summary

8.1 Human Health and Safety

The toxicology database submitted for glyphosate is adequate to define the majority of toxic effects that may result from exposure. Observations of slight systemic toxicity consisting of decreased body weight and body-weight gain, altered hepatic and renal functions, and diarrhea were common in the toxicity studies with glyphosate. Cellular changes in the salivary glands were also observed in the rodent studies. Glyphosate was not genotoxic or neurotoxic. A marginally increased incidence of ovarian adenomas was observed in mice, but at the limit dose only. These tumours were considered to be of low degree of concern for human health risk assessment. Glyphosate produced an altered response of the immune system. No evidence of increased sensitivity of the young was observed in the reproduction or prenatal developmental toxicity studies.

However, the finding of fetal cardiovascular malformations in the presence of maternal toxicity in a rabbit developmental toxicity was considered a serious effect. The risk assessment protects against the toxic effects noted above by ensuring that the level of human exposure is well below the lowest dose at which these effects occurred in the animal tests.

8.1.1 Dietary Risk

There were no dietary risk concerns from the acute and chronic dietary risk assessments (food and drinking water) for the general population and all population subgroups, including infants, children, teenagers, adults and seniors.

8.1.2 Non-Occupational Risk

Risks to residential applicators for all residential label uses are not of concern. Residential postapplication risk is not of concern, including from golfing and incidental oral exposure. There is no risk of concern for bystanders entering treated sites.

8.1.3 Occupational Risk

Risk estimates associated with mixing, loading and applying activities for all commercial label uses are not of concern.

Postapplication risks for workers were not of concern. An REI of 12 hours is required for all agricultural postapplication activities.

8.1.4 Aggregate Risk

There were no risks of concern from aggregate exposure to glyphosate from food, drinking water and residential uses.

8.1.5 Polyethoxylated Tallow Amines

No risks of concern were identified, provided end-use products contain no more than 20% POEA by weight.

8.2 Environmental Risk

Available studies indicate that in the natural environment, glyphosate is non-persistent to moderately persistent in soil and water and produces one major transformation product in soil and water, aminomethyl phosphonic acid (AMPA), which is non-persistent to persistent in the environment. Carryover of glyphosate and AMPA into the next growing season is not expected to be significant. Glyphosate and AMPA are expected to be immobile in soil and are unlikely to leach to groundwater. Glyphosate is very soluble in water and non-volatile and is expected to partition to sediment in aquatic environments. Glyphosate and AMPA are unlikely to bioaccumulate.

Certain glyphosate formulations include the surfactant POEA, which is non-persistent to slightly persistent in the environment and is toxic to aquatic organisms. In general, glyphosate formulations that contain POEA are more toxic to freshwater and marine/estuarine organisms than formulations that do not contain POEA. POEA compounds have the potential to bioaccumulate but given that the components are easily broken down and that it is not persistent in soil and water, significant bioaccumulation under field conditions is unlikely.

In the terrestrial environment the only area of risk concern identified from the available data was for terrestrial plants and therefore spray buffer zones are required to reduce exposure to sensitive terrestrial plants. Glyphosate formulations containing POEA may pose a risk to freshwater invertebrates, freshwater plants and marine/estuarine invertebrates. Glyphosate formulations that do not contain POEA may pose a risk to freshwater algae only. Glyphoste technical grade active ingredient is toxic to estuarine/marine fish. Hazard statements and mitigation measures (spray buffer zones) are required on product labels to protect aquatic organisms.

Due to its rapid dissipation and low toxicity, the transformation product AMPA is not expected to pose a risk to terrestrial and aquatic organisms based on proposed application rate of glyphosate.

8.3 Value

Glyphosate is an important herbicide for Canadian agriculture as well as for weed control in non-agricultural land management.

9.0 Proposed Re-evaluation Decision

9.1 Proposed Regulatory Actions

After a re-evaluation of glyphosate, Health Canada's PMRA, under the authority of the *Pest Control Products Act*, is proposing continued registration of glyphosate and associated end-use products for certain uses of glyphosate in Canada, provided that the mitigation measures for the health and the environment described in this document are implemented.

9.1.1 Proposed Regulatory Action Related to Human Health

9.1.1.1 Proposed Label Amendments

1) Label amendments for the glyphosate technical product labels are proposed and summarized in Appendix XII.
2) The restricted entry interval of 12 hours is proposed for all agricultural uses (Appendix XII).
3) There may be potential for exposure to bystanders from drift following pesticide application to agricultural areas. In the interest of promoting best management practices and to minimize human exposure from spray drift or from spray residues resulting from drift, label statement is proposed under Use Precautions (Appendix XII).

9.1.1.2 Residue Definition for Risk Assessment and Enforcement

Glyphosate is registered for use on a wide range of conventional crops (in other words, glyphosate non-tolerant crops) as well as on transgenic crops (in other words, glyphosate tolerant crops). Currently registered transgenic crops include crops containing the 5-enolpyruvylshikimate-3-phosphate synthase (EPSPS) gene and/or the glyphosate oxidoreductase (GOX) gene and crops containing the glyphosate *N*-acetyl transferase (GAT) gene (in other words, soybeans, corn and canola). The residue definition (RD) in all conventional crops and in transgenic EPSPS/GOX crops is comprised of glyphosate and the metabolite AMPA. The RD in transgenic GAT crops is the sum of glyphosate and the metabolites *N*-acetylglyphosate, AMPA and *N*-acetyl AMPA. The RD in animal commodities is the sum of glyphosate and the metabolites *N*-acetylglyphosate and AMPA. These RDs are used for both enforcement and dietary risk assessment purposes. No modification to the current RDs is proposed as the result of this re-evaluation. The metabolites included in the RDs are expressed as stoichiometric equivalents of glyphosate. The RD in drinking water for dietary risk assessment is defined as the sum of glyphosate and the metabolite AMPA. The acetylated metabolites are not included in the RD for drinking water because they are not formed in soil. In other words, *N*-acetylglyphosate is not applied to plants; it is rather a metabolite produced in GAT crops as a result of the application of glyphosate.

9.1.1.3 Maximum Residue Limits for Glyphosate in Food

Maximum residue limits (MRLs) have been specified for residues of glyphosate (including all the metabolites comprised in the RDs) and the trimethylsulfonium (TMS) cation, the major metabolite of the discontinued glyphosate-TMS salt, in/on registered crops. Information on Canadian MRLs is presented in Appendix VI.

MRLs for pesticides in/on food are established by Health Canada's PMRA under the authority of the *Pest Control Products Act*. After the revocation of an MRL or where no specific MRL is specified for a pesticide under the *Pest Control Products Act*, Subsection B.15.002(1) of the Food and Drug Regulations applies. This requires that residues do not exceed 0.1 ppm, which is considered as a general MRL for enforcement purposes. Therefore, residues in/on all other crops appearing on the registered glyphosate labels are regulated under the general MRL not to exceed 0.1 ppm for glyphosate (including relevant metabolites) and 0.1 ppm for the TMS cation.

In general, when the re-evaluation of a pesticide has been completed, the PMRA intends to remove Canadian MRLs that are no longer supported. Given that all glyphosate-TMS-containing products have been discontinued, it is proposed that all MRLs for the TMS cation be revoked.

A complete list of MRLs established in Canada can be found in the PMRA MRL database on the Pesticides and Pest Management section of the Health Canada website. The database is an online query application that allows users to search for established MRLs regulated under the *Pest Control Products Act*. For supplemental MRL information regarding the international situation and trade implications, refer to Appendix VI.

9.1.1.4 Proposed Mitigation Measures Related to Products Containing Polyethoxylated Tallow Amines

The determination of acceptable risk for the POEA health evaluation is applicable to end-use products that contain no more than 20% POEA by weight. As such, registrants will be required to ensure that end-use products comply with the maximum of 20% POEA by weight.

9.1.2 Proposed Regulatory Action Related to the Environment

To reduce the effects of glyphosate in the environment, mitigation in the form of precautionary label statements and spray buffer zones are required. Environmental mitigation statements are listed in Appendix XII.

9.1.3 Other Label Amendments

Information on cumulative rate per year, maximum number of applications per year and minimum interval between applications is not currently specified on labels for use on agricultural cropland and non-cropland, as it is for fruit tree, berry and vine crops. In order for use directions for glyphosate products to be consistent with the assumptions used in the PMRA health risk assessment, it is recommended that labels be updated to include this information for all sites, as described in Appendix II.

9.2 Additional Data Requirements

No additional data are required under section 12 of the *Pest Control Products Act*.

Note that in addition to data supplied by registrants and published information, certain studies from non-glyphosate task forces were used in the risk assessments. These are included in the reference list of this document:

- Activity specific transfer coefficients from the Agricultural Reentry Task Force (ARTF, 2008) were used in the assessment of postapplication agriculture exposure.

- The USEPA Residential SOPs (2012) were also used in the risk assessment for glyphosate. Data from several exposure task forces were used to develop the Residential SOPs. Specifically ARTF, Agricultural Handlers Exposure Task Force (AHETF), and Outdoor Residential Exposure Task Force (ORETF) data are included in the scenarios used from the SOPs.

Furthermore, the PMRA is in the process of revising its approach to buffer zones for all chemicals. Information (data, research) that would facilitate buffer zone refinement may be submitted during the consultation period of this Proposed Re-evaluation Decision. Buffer zones for glyphosate may be revised based on new information as a result of this process.

List of Abbreviations

Abs.	Absolute
AD	administered dose
ADI	acceptable daily intake
ADME	absorption, distribution, metabolism and excretion
AFC	antibody forming cell
a.e.	acid equivalent
AHETF	Agricultural Handlers Exposure Task Force
AHS	agricultural health study
a.i.	active ingredient
ALT	alanine aminotransferase
AMPA	aminomethylphosphonic acid
ALP	alkaline phosphatase
AR	applied radioactivity
ARfD	acute reference dose
ARTF	Agricultural Re-entry Task Force
AST	Aspartate transaminase
ATPD	area treated per day
atm	atmosphere
BAF	bioaccumulation factor
BCF	bioconcentration factor
BUN	blood urea nitrogen
bw	body weight
BWG	body-weight gain
$[Ca^{++}]$	concentration of calcium
CAF	composite assessment factor
CAS	Chemical Abstracts Service
CFIA	Canadian Food Inspection Agency
cm	centimetres
cm^2	entimetres squared
CSFII	Continuing Surveys of Food Intakes by Individuals
DA	dermal absorption
DBH	diameter at breast height
DFOP	double first order in parallel
DFR	dislodgeable foliar residue
DNA	deoxyribonucleic acid
DT_{50}	dissipation time 50% (the time required to observe a 50% decline in concentration)
DT_{90}	dissipation time 90% (the time required to observe a 90% decline in concentration)
EbR_{50}	effective biomass rate on 50% of the population
EC_{25}	effective concentration on 25% of the population
EC_{50}	effective concentration on 50% of the population
EDE	estimated daily exposure
EEC	estimated environmental concentration
EFSA	European Food Safety Authority

EIIS	Ecological Incident Information System from USEPA
EPA	Environmental Protection Agency
EPSPS	5-enolpyruvylshikimate-3-phosphate synthase
ER_{50}	effective rate on 50% of the population
ERS	exposure re-evaluation section
et al.	and others
EXAMS	Exposure Analysis Modeling System
F_1	first generation
F_2	second generation
F_{2b}	pertaining to offspring produced from the second mating of the second generation
FC	food consumption
FE	food efficiency
FIR	food ingestion rate
FOB	functional observational battery
g	gram(s)
GAT	glyphosate *N*-acetyl transferase
GD	gestation day
GMO	genetically modified organism
GOX	glyphosate oxidoreductase
GUS	groundwater ubiquity score
ha	hectare
HC	historical control
HC_5	hazardous concentration to 5% of the species
HED	Health Evaluation Directorate
hr(s)	hour(s)
HPLC	high performance liquid chromatography
IARC	International Agency for Research on Cancer
IgM	Immunoglobulin M
IUPAC	International Union of Pure and Applied Chemistry
IV	intravenous(ly)
$[K^+]$	concentration of potassium ion
kg	kilogram(s)
K_d	soil-water partition coefficient
K_F	Freundlich adsorption coefficient
K_{oc}	organic-carbon partition coefficient
K_{ow}	octanol-water partition coefficient
L	litre(s)
LC_{50}	lethal concentration to 50%
LD	lactation day
LD_{50}	lethal dose to 50%
LOAEL	lowest observed adverse effect level
LOC	level of concern
LOEC	lowest observed effect concentration
LOD	limit of detection
LOQ	limit of quantitation
LR_{50}	lethal rate 50%
m	metres
m^2	metres squared

max	maximum
mg	milligram
min	minutes
MIS	maximal irritation score
mL	millilitre
M/L/A	mixer/loader/applicator
mmHg	millimetres of mercury
MOE	margin of exposure
MRL	maximum residue limit
MS	mass spectrometry
MTD	maximum tolerated dose
n/a	not available
N/A	not applicable
ND	not determined
NOAEL	no observed adverse effect level
NOEC	no observed effect concentration
NOEL	no observed effect level
NR	not reported
NTP	National Toxicology Program
NZW	New Zealand White
OC	organic carbon content
OECD	Organisation for Economic Co-Operation and Development
OM	organic matter content
ORETF	Outdoor Residential Exposure Task Force
P	parental generation
pChE	plasma cholinesterase
PDP	Pesticide Data Program (United States data)
PHED	Pesticide Handlers Exposure Database
PHI	preharvest interval
p*K*a	dissociation constant
PMRA	Pest Management Regulatory Agency
PND	postnatal day
POEA	polyethoxylated tallow amine
PPE	personal protective equipment
PRZM	Pesticide Root Zone Model
ppm	parts per million
RBC	red blood cell
RD	residue definition
REI	restricted entry interval
Rel.	relative
RfD	reference dose
ROW	right-of-way
RSD	Relative Standard Deviation
RQ	risk quotient
S9	supernatant fraction from liver homogenate obtained by centrifuging at 9000 g
SD	Sprague-Dawley
SFO	single first order
SOP	standard operating procedure

$t_{1/2}$	half-life
$t_{rep\ ½}$	representative half-life of kinetic models
TC	transfer co-efficient
TLC	thin layer shromatography
TMS	trimethylsulfonium
TSMP	Toxic Substances Management Policy
TTR	turf transferable residue
UF	uncertainty factor
µg	microgram
µL	microlitres

Appendix I Products Containing Glyphosate that are Registered in Canada Excluding Discontinued Products or Products with a Submission for Discontinuation as of 3 May 2012, Based Upon the PMRA's Electronic Pesticide Regulatory System (e-PRS) Database[1]

Registration Number	Marketing Type[2]	Registrant Name	Product Name	Formulation Type	Guarantee[3] (Salt Form – g a.e./L)
29995	C	Agwest Inc.	Crush'r Plus	Solution	GPI-360
28322	C	Albaugh Inc.	Clearout 41 Plus Herbicide Solution	Solution	GPI-360
30093	C	Alligare, LLC.	Alligare Glyphosate 4+	Solution	GPI-360
29677	C	Chanoix Trading Inc.	Lajj Plus	Solution	GPI-360
26828	C	Cheminova Canada, Inc.	Cheminova Glyphosate Soluble Concentrate Herbicide	Solution	GPI-356
27287	C		Glyfos Au Soluble Concentrate Herbicide	Solution	GPI-360
28925	C		Cheminova Glyphosate (TM) II	Solution	GPI-356
29363	C		Glyfos Bio Herbicide	Solution	GPI-360
29364	C		Glyfos Bio 450 Herbicide	Solution	GPI-450
30234	C		Forza Bio Silvicultural Herbicide	Solution	GPI-360
30235	C		Forza Bio 450 Silvicultural Herbicide	Solution	GPI-450
27394	C	Dow Agrosciences Canada Inc.	Prepass B Herbicide Solution (A Component Of Prepass Htm)	Solution	GPI-360;
27615	C		Vantage Plus Max Herbicide Solution	Solution	GPI-480
28245	C		Maverick II Herbicide Solution	Solution	GPI-480
28540	C		Eclipse II B Herbicide Solution	Solution	GPI-480
28977	C		Maverick III Herbicide Solution	Solution	GPX-480
29033	C		Eclipse III B Herbicide	Solution	GPX-480
29652	C		Prepass XC B Herbicide	Solution	GPX-480
29994	C		Vantage XRT Herbicide	Solution	GPX-480
21262	C	Ezject, Inc.	Diamondback Herbicide Shells	Paste	GPI-0.15
29731	C	Global Ag Brands Inc.	Glyking	Solution	GPI-360
29732	C		Clean-Up	Solution	GPI-360
26846	C	Interprovincial Cooperative Limited	Glyphosate Herbicide – Agricultural and Industrial	Solution	GPI-360
29216	C		Glyphosate Water Soluble Herbicide	Solution	GPI-309(+51)
29266	C	Libertas Now Inc.	Knockout Extra	Solution	GPI-360
29517	C		Burndown	Solution	GPI-360
29524	C		Clearcrop	Solution	GPI-360
29525	C		Cleanfield	Solution	GPI-360
29733	C		GP Advantage	Solution	GPI-360
28623	C	Loveland Products Canada Inc.	Sharpshooter Plus Herbicide	Solution	GPI-360
28631	C		Sharpshooter Herbicide	Solution	GPI-356
29126	C	Mey Canada Corporation	Wise Up Herbicide Solution	Solution	GPI-356
19536	C	Monsanto Canada Inc.	Rustler Summerfallow Herbicide	Solution	GPI-108 DXB-182
20423	C		Mocan 943 Water Soluble Herbicide	Solution	GPI-120 DIC-86

Registration Number	Marketing Type[2]	Registrant Name	Product Name	Formulation Type	Guarantee[3] (Salt Form – g a.e./L)
21572	C		Rustler Fallow Liquid Herbicide	Solution	GPI-132 DIC-60
25604	C		Roundup Fast Forward Preharvest Herbicide	Solution	GPI-300 GLG-16
25795	C		Roundup Fastforward Preseed Agricultural	Solution	GPI-300 GLG-10
25898	C		Focus Herbicide	Solution	GPI-132 DXB-82
25918	C		Mon 77759 Water Soluble Herbicide	Solution	GPI-300 GLG-36
26625	C		Mon 78027 Water Soluble Herbicide	Solution	GPI-180 GLG-131
26920	C		Roundup Transorb Max Liquid Herbicide	Solution	GPI-480
27200	C		Rustler Liquid Herbicide	Solution	GPI-194 DIC-46
29841	C		Mon 76431 Liquid Herbicide	Solution	GPP-540
29868	C		Mon 76429 Liquid Herbicide	Solution	GPP-540
29290	C	Newagco Inc.	Mpower Glyphosate	Solution	GPI-356
25866	C	Nufarm Agriculture Inc.	Nufarm Credit Liquid Herbicide	Solution	GPI-356
27950	C		Credit Plus Liquid Herbicide	Solution	GPI-360
29124	C		Credit 45 Herbicide	Solution	GPI-450
29125	C		Nufarm Credit 360 Liquid Herbicide	Solution	GPI-360
29470	C		Nuglo Herbicide	Solution	GPI-450
29471	C		Nufarm Glyphosate 450 Herbicide	Solution	GPI-450
29479	C		Polaris	Solution	GPI-360
29480	C		Racketeer	Solution	GPI-360
29888	C		Credit Xtreme Herbicide	Solution	GPO-540
30442	C	Rack Petroleum Ltd.	The Rack Glyphosate	Solution	GPI-360
28802	C	Syngenta Canada Inc.	Cycle Herbicide	Solution	GPP-500
29308	C		Touchdown Pro Herbicide	Solution	GPM-360
29341	C		Halex GT Herbicide	Solution	GPP-250 AME-250 MER-25
29552	C		Takkle Herbicide	Solution	GPI-140 DIC-70
29644	C		Flexstar Herbicide	Solution	GPM-315 FOF-79
30412	C		Flexstar GT Herbicide	Solution	GPM-271 FOF-67
29022	C	Teragro Inc	Weed-Master Glyphosate 41 Herbicide	Solution	GPS-356
29629	C	Viterra Inc.	Viterra Glyphosate	Solution	GPI-360
24359	C+R	Cheminova Canada, Inc.	Glyfos Soluble Concentrate Herbicide	Solution	GPI-360
26401	C+R		Forza Silvicultural Herbicide	Solution	GPI-360
28924	C+R		Glyfos Soluble Concentrate Herbicide II	Solution	GPI-360
26171	C+R	Dow Agrosciences Canada Inc.	Vantage Plus Herbicide Solution	Solution	GPI-360
26172	C+R		Vantage Herbicide Solution	Solution	GPI-356
26884	C+R		Vantage Forestry Herbicide Solution	Solution	GPI-356
28840	C+R		Vantage Plus Max II Herbicide Solution	Solution	GPX-480
29588	C+R		GF-772 Herbicide	Solution	GPI-360
29773	C+R		Depose Herbicide Solution	Solution	GPI-356
29774	C+R		Durango Herbicide Solution	Solution	GPX-480

Registration Number	Marketing Type[2]	Registrant Name	Product Name	Formulation Type	Guarantee[3] (Salt Form – g a.e./L)
30423	C+R		Prepass 480 Herbicide Solution	Solution	GPX-480
30516	C+R		Vantage Max Herbicide Solution	Solution	GPS-480
27988	C+R	Interprovincial Cooperative Limited	Ipco Factor 540 Liquid Herbicide	Solution	GPP-540
29775	C+R		Matrix Herbicide Solution	Solution	GPX-480
30319	C+R		Vector Herbicide Solution	Solution	GPX-480
30076	C+R	Loveland Products Canada Inc.	Mad Dog Plus	Solution	GPI-360
29219	C+R	Makhteshim Agan Of North America Inc.	Glyphogan Plus Liquid Herbicide	Solution	GPI-356
19899	C+R	Monsanto Canada Inc.	Vision Silviculture Herbicide	Solution	GPI-356
25344	C+R		Roundup Transorb Liquid Herbicide	Solution	GPI-360
27487	C+R		Roundup Weathermax With Transorb 2 Technology Liquid Herbicide	Solution	GPP-540
28486	C+R		Roundup Ultra 2 Liquid Herbicide	Solution	GPP-540
28487	C+R		R/T 540 Liquid Herbicide	Solution	GPP-540
28608	C+R		Mon 79828 Liquid Herbicide	Solution	GPP-540
28609	C+R		Mon 79791 Liquid Herbicide	Solution	GPP-540
29498	C+R		Start Up Herbicide	Solution	GPP-540
30104	C+R		Mon 76669	Solution	GPP-540
27736	C+R		Vision Max Silviculture Herbicide	Solution	GPP-540
27764	C+R		Roundup Ultra Liquid Herbicide	Solution	GPP-540
27946	C+R		Renegade HC Liquid Herbicide	Solution	GPP-540
28198	C+R		Roundup Transorb HC Liquid Herbicide	Solution	GPP-540
27192	C+R	Syngenta Canada Inc.	Touchdown IQ Liquid Herbicide	Solution	GPM-360
28072	C+R		Touchdown Total Herbicide	Solution	GPP-500
29201	C+R		Traxion Herbicide	Solution	GPP-500
29009	C+R	Teragro Inc	Weed-Master Glyphosate Forestry Herbicide	Solution	GPI-356
26609	D	Cheminova Canada, Inc.	Glyfos Herbicide 143 Concentrate	Solution	GPI-143
26610	D		Glyfos Herbicide 7 Ready-To-Use	Solution	GPI-7
26827	D		Glyfos Concentrate 356 Herbicide	Solution	GPI-356
27351	D	Dow Agrosciences Canada Inc.	Glyphosate 18% Herbicide Solution Concentrate	Solution	GPI-143
27352	D		Glyphosate 0.96% Herbicide Ready-To-Use	Solution	GPI-7
22627	D	Monsanto Canada Inc.	Roundup Concentrate Non-Selective Herbicide	Solution	GPI-143
22759	D		Roundup Super Concentrate Grass & Weed Control	Solution	GPI-356
22807	D		Roundup Ready To Use Non-Selective Herbicide With Fastact Foam	Solution	GPI-7
23786	D		Roundup Quik Stik Non-Selective Herbicide Tablets	Tablet	GPS-60
24299	D		Roundup Ready-To-Use Grass & Weed Control With Fastact Foam	Solution	GPI-7
26263	D		Roundup Ready-To-Use With Fastact Foam Pull'n Spray Non-Selective Herbicide	Solution	GPI-7
27460	D		Roundup Ready-To-Use Non-Selective Herbicide	Solution	GPI-7.2
27506	D		Roundup Ready-To-Use Pull’n Spray Non-Selective Herbicide	Solution	GPI-14.0
27507	D		Roundup Ready-To-Use Pull'n Spray Poison Ivy & Brush Control Non-Selective Herbicide	Solution	GPI-14.0
28974	D		Roundup Pump’N Go	Solution	GPI-7

Registration Number	Marketing Type[2]	Registrant Name	Product Name	Formulation Type	Guarantee[3] (Salt Form – g a.e./L)
29003	D		Roundup Ready-To-Use Poison Ivy & Brush Control Non-Selective Herbicide	Solution	GPI-14
29034	D		Roundup Ready-To-Use Poison Ivy & Brush Control With Quick Connect Sprayer	Solution	GPI-14
27013	D	Sure-Gro IP Inc.	Later's Grass & Weed Killer Ready To Use	Solution	GPI-7
27014	D		Later's Grass & Weed Killer Concentrate	Solution	GPI-143
27015	D		Later's Grass & Weed Killer Super Concentrate	Solution	GPI-356
29580	D		Later's Grass & Weed Killer Ready To Use EZ Spray	Solution	GPI-7
29307	D	Syngenta Canada Inc.	Touchdown Ready-To-Use Herbicide	Solution	GPM-8.4
29309	D		Touchdown Super Concentrate Herbicide	Solution	GPM-360
29310	D		Touchdown Diquat Quick-Kill Ready-To-Use Herbicide	Solution	GPM-8.3 DIQ-0.28
28464	D	Teragro Inc	Totalex Concentrate Brush, Grass & Weed Killer Home Gardener	Solution	GPI-143
28467	D		Totalex Concentrate Brush, Grass & Weed Killer Virterra	Solution	GPI-143
28469	D		Totalex Ready-To-Use Brush, Grass & Weed Killer Virterra	Solution	GPI-7
28470	D		Totalex Ready-To-Use Brush, Grass & Weed Killer Home Gardener	Solution	GPI-7
28471	D		Totalex Super Concentrate Brush, Grass & Weed Killer Home Gardener	Solution	GPI-356
28472	D		Totalex Super Concentrate Brush, Grass & Weed Killer Virterra	Solution	GPI-356
28574	D		Totalex Rtu Brush, Grass & Weed Killer With 1 Touch Power Sprayer Home	Solution	GPI-7.0
28575	D		Totalex Rtu Brush, Grass & Weed Killer With 1 Touch Power Sprayer	Solution	GPI-7.0
28576	D		Totalex Extra Strength Rtu Brush, Grass & Weed Killer With 1 Touch Power Sprayer Home Gardener	Solution	GPI-14
28577	D		Totalex Extra Strength Rtu Brush, Grass & Weed Killer With 1 Touch Power Sprayer Virterra	Solution	GPI-14
25600	M	Cheminova Canada, Inc.	Glyphosate Concentrate Herbicide	Solution	GPI-46.3
27497	M		Glyfos 356 MUC	Solution	GPI-356
26449	M	Dow Agrosciences Canada Inc.	Glyphosate 62% Solution Manufacturing Concentrate	Solution	GPI-46
27074	M		Vantage Herbicide Solution Manufacturing Concentrate	Solution	GPI-356
27075	M		Vantage Plus Herbicide Solution Manufacturing Concentrate	Solution	GPI-360
28783	M		Gf-1667 Herbicide Manufacturing Concentrate	Solution	GPX-49
28963	M		Glyphosate 85% Manufacturing Concentrate	Solution	GPS-85
29267	M	Libertas Now Inc.	Knockout 62	Solution	GPI-46.0
21061	M	Monsanto Canada Inc.	Mon 0139 Solution Herbicide Manufacturing Concentrate	Solution	GPI-46.0
26919	M		Mon 77945 Herbicide Manufacturing Concentrate Solution	Solution	GPI-46
27183	M		Mon 77973 Herbicide Manufacturing Concentrate	Solution	GPS-85
27485	M		Mon 78623 Herbicide Manufacturing Concentrate	Solution	GPP-47.3
28603	M		Mon 79380 Herbicide Manufacturing Concentrate	Solution	GPP-540
28604	M		Mon 79582 Herbicide Manufacturing Concentrate	Solution	GPP-540
28605	M		Mon 79544 Herbicide Manufacturing	Solution	GPP-540

29381	T	Newagco Inc.	Newagco Glyphosate Technical	Solid	GPS-96.0
28857	T	Nufarm Agriculture Inc.	Nufarm Glyphosate Technical Acid	Solid	GPS-96.5
29980	T	Sharda Worldwide Exports Pvt. Ltd./Sharda International Fze	Sharda Glyphosate Technical Herbicide	Solid	GPS-96.2
24344	T	Syngenta Canada Inc.	Glyphosate Acid Wet Paste Herbicide	Paste	GPS-88.8
28983	T		Technical Touchdown Herbicide	Solid	GPS-97.1
29540	T		Touchdown Technical Herbicide	Solid	GPS-99
28882	T	Teragro Inc	Glyphosate Technical Herbicide	Solid	GPS-97.5

[1] GPS = glyphosate acid, GPI = glyphosate isopropylamine or ethnolamine salt, GPM = glyphosate mono-ammonium or diammonium salt, GPP = glyphosate potassium salt, GPX = glyphosate dimethylsulfonium salt, and GPO = GPI + GPP. Note that GPT (gltphosate trimethylsulfonium salt) has been voluntarily discontinued by the registrant Syngenta Canada Inc.

[2] C = Commercial Class, C+R = Commercial and Restricted Class, D = Domestic Class, M = Manufacturing Concentrate, T = Technical grade active ingredient.

[3] AME = s-metolachlor, DIC = dicamba, DIQ = diquat, DXB = 2,4-D (isomer specific), FOF = fomesafen, GLG = glufosinate ammonium and MER = mesotrione.

Appendix IIa Registered Commercial Class Uses of Glyphosate in Canada as of 3 May 2012. Uses From Discontinued Products or Products With a Submission for Discontinuation are Excluded[1]

USCs[2]	Sites[3]	Weeds and/or Harvest Management	Application Methods and Equipment[4]	Maximum Application Rate (kg a.e./ha)		Maximum Number of Applications Per Year[5]	Minimum Interval Between Applications (Days)[5]
				Single	Cumulative Per Year[5]		
13 14	Wheat Barley Oats	Weed control: Annual and perennial weeds Harvest management	Boom or boomless **Aerial – Prairie provinces only (including Peace River region of British Columbia) – Restricted use** Knapsack or high-volume equipment (hose and handguns, hand sprayer or other suitable nozzle arrangement)	4.320	9.542	4	[7]
13 14	Rye	Annual weeds and foxtail barley	Field sprayer **Aerial – Prairie provinces only (including Peace River region of British Columbia) – Restricted use**	0.902	0.902	1	Not applicable
7 13 14	Soybeans	Weed control: Annual and perennial weeds Harvest management	Boom or boomless **Aerial – Prairie provinces only (including Peace River region of British Columbia) – Restricted use** Knapsack or high-volume equipment (hose and handguns, hand sprayer or other suitable nozzle arrangement) Boom or boomless Roller applicators Wick or other wiper applicators	4.320	9.542	6	[7]
7 13 14	Soybeans (Glyphosate tolerant or Roundup Ready soybean varieties or Roundup Ready 2 Yield soybean varieties)	Weed control: Annual and perennial weeds Harvest management	Boom or boomless **Aerial – Prairie provinces only (including Peace River region of British Columbia) – Restricted use**	4.320	12.062	5	[7] For in crop treatment, 14 for sequential application and the second application must be no later than flowering stage of soybean.

USCs[2]	Sites[3]	Weeds and/or Harvest Management	Application Methods and Equipment[4]	Maximum Application Rate (kg a.e./ha)		Maximum Number of Applications Per Year[5]	Minimum Interval Between Applications (Days)[5]
				Single	Cumulative Per Year[5]		
7 13 14	Corn	Annual and perennial weeds	Boom or boomless **Aerial – Prairie provinces only (including Peace River region of British Columbia) – Restricted use** Knapsack or high-volume equipment (hose and handguns, hand sprayer or other suitable nozzle arrangement)	4.320	8.640	3	[7]
7 13 14	Corn (glyphosate tolerant)	Annual and perennial weeds	Boom or boomless **Aerial – Prairie provinces only (including Peace River region of British Columbia) – Restricted use**	4.320	10.445	4	[7]
14	Corn – Sweet (Roundup Ready 2 Technology)	Annual and perennial weeds	Boom or boomless **Aerial – Prairie provinces only (including Peace River region of British Columbia) – Restricted use**	4.320	10.438	4	[7]
7 13 14	Canola	Weed Control: Annual and perennial weeds Harvest management	Boom or boomless **Aerial – Prairie provinces only (including Peace River region of British Columbia) – Restricted use**	4.320	9.542	3	[7]
7 13 14	Canola (glyphosate tolerant)	Weed Control: Annual and perennial weeds Harvest management	Boom or boomless **Aerial – Prairie provinces only (including Peace River region of British Columbia) – Restricted use**	4.320	10.890	5	[7]
7	Canola – Roundup Ready Hybrid canola seed production	When pollination is complete or near completion	Boom sprayer	0.902	1.804	2 (sequential application)	At least 5 days
13 14	Peas	Weed Control: Annual and perennial weeds Harvest management	Boom or boomless **Aerial – Prairie provinces only (including Peace River region of British Columbia) – Restricted use**	4.320	9.542	3	[7]
14	Dry beans	Weed Control: Annual and perennial weeds Harvest management	Boom or boomless **Aerial – Prairie provinces only (including Peace River region of British Columbia) – Restricted use** Knapsack or high-volume equipment (hose and handguns, hand sprayer or other suitable nozzle arrangement) Roller applicators Wick or other wiper applicators	4.320	9.542	6	[7]

USCs[2]	Sites[3]	Weeds and/or Harvest Management	Application Methods and Equipment[4]	Maximum Application Rate (kg a.e./ha)		Maximum Number of Applications Per Year[5]	Minimum Interval Between Applications (Days)[5]
				Single	Cumulative Per Year[5]		
7 13 14	Flax (including low linoleic acid varieties)	Weed control: Annual and perennial weeds Harvest management	Boom or boomless **Aerial – Prairie provinces only (including Peace River region of British Columbia) – Restricted use**	4.320	9.542	3	[7]
14	Lentils	Weed control: Annual and perennial weeds Harvest management	Boom or boomless **Aerial – Prairie provinces only (including Peace River region of British Columbia) – Restricted use**	4.320	9.542	3	[7]
13 14	Chickpeas Lupin (dried) Fava bean (dried)	Weed control: Annual and perennial weeds Harvest management	Boom or boomless **Aerial – Prairie provinces only (including Peace River region of British Columbia) – Restricted use**	4.320	9.542	3	[7]
7 13 14	Mustard (yellow/white, brown, oriental)	Weed control: Annual and perennial weeds Harvest management	Boom or boomless **Aerial – Prairie provinces only (including Peace River region of British Columbia) – Restricted use**	4.320	9.542	3	[7]
13	Pearl millet (pearl millet grain is to be harvested for use as animal feed only. Do not graze treated pearl millet forage or cut for hay.)	Weed control: Annual and perennial weeds Harvest management	Boom or boomless **Aerial – Prairie provinces only (including Peace River region of British Columbia) – Restricted use**	4.320	9.542	3	[7]
14	Sorghum (grain) (not for use as a forage crop)	Weed control: Annual and perennial weeds Harvest management	Boom or boomless **Aerial – Prairie provinces only (including Peace River region of British Columbia) – Restricted use**	4.320	9.542	3	[7]
7 13 14	Sugar beets	Annual and perennial weeds	Boom or boomless **Aerial – Prairie provinces only (including Peace River region of British Columbia) – Restricted use** Knapsack sprayers, hand held and high-volume equipment handguns or other suitable nozzle arrangement	4.320	12.600	3	[7]
7 13 14	Sugar beets (Roundup Ready only)	Emerged annual and perennial weeds	Boom or boomless **Aerial – Prairie provinces only (including Peace River region of British Columbia) – Restricted use**	0.902	3.607	4	10

USCs[2]	Sites[3]	Weeds and/or Harvest Management	Application Methods and Equipment[4]	Maximum Application Rate (kg a.e./ha)		Maximum Number of Applications Per Year[5]	Minimum Interval Between Applications (Days)[5]
				Single	Cumulative Per Year[5]		
14	Asparagus	Annual and perennial weeds	Boom or boomless	4.320	12.600	3	[7]
14	Ginseng (North American) – new garden (BC only)	Volunteer grain	Boom sprayer, shielded sprayer, hand-held guns	0.902	0.902	1	Not applicable
	Ginseng (North American) – Existing/established gardens			0.902	1.804	2	[7]
13	Forage grasses and legume including seed production	Weed control: Annual and perennial weeds Harvest management	Boom or boomless Knapsack or high-volume equipment (hose and handguns, hand sprayer or other suitable nozzle arrangement)	4.320	10.440	4	[7]
13	Pasture	Annual and perennial vegetation Most herbaceous weeds, woody brush and trees	Boom or boomless Mist blower Hand-held high volume equipment **Ground Restricted use** **Aerial Restricted use**	4.320	8.640	2	[7]
14	Strawberry	Annual and perennial weeds	Boom or boomless Knapsack or high-volume equipment (hose and handguns, hand sprayer or other suitable nozzle arrangement) Wiper	4.320	12.600	4	[7]
14	Blueberry (highbush)	Annual and perennial weeds	Boom or boomless Shielded sprayer, hand held and high-volume orchards guns Knapsack or high-volume equipment (hose and handguns, hand sprayer or other suitable nozzle arrangement)	4.320	12.600	3	[7]
14	Blueberry (lowbush)	Annual and perennial weeds Woody brush	Boom or boomless Shielded sprayer, hand held and high-volume orchards guns Knapsack or high-volume equipment (hose and handguns, hand sprayer or other suitable nozzle arrangement)	4.320	12.600	3	[7]
14	Cranberry	Annual and perennial weeds	Boom or boomless Wipers and wicks	4.320	12.600	2	[7]
13 (apples only)	Apples Apricot Cherry – (Sweet/Sour) Peaches	Annual and perennial weeds	Boom sprayer, shielded sprayer, hand held and high-volume orchards guns Rollers	4.320	12.600	3	[7]

USCs[2]	Sites[3]	Weeds and/or Harvest Management	Application Methods and Equipment[4]	Maximum Application Rate (kg a.e./ha)		Maximum Number of Applications Per Year[5]	Minimum Interval Between Applications (Days)[5]
				Single	Cumulative Per Year[5]		
14	Pears Plums		Wick or other wiper applicators

1. All uses are supported by the registrants. Information in [ ] is provided by the registrants.
2. USCs 1 to 14 belong to the use sector AGRICULTURE AND FORESTRY, USCs 15-23 belong to the use sector INDUSTRY and USCs 24-33 belong to the use sector SOCIETY.
3. Sites are either as stated on the product label or as interpreted by the PMRA so as to achieve consistency in naming. For agricultural cropland use, the labels state that all crops can be treated with glyphosate prior to planting. This “prior to planting use on all crops” is captured in two parts. (1) It is captured in the Site column corresponding to the crop which appears on the labels for other use claim(s). For example, wheat appears on the label for in-crop spot treatment as well as pre-harvest application; the “prior to planting use” is added under the Wheat site; (2) It is captured in the “All other crops” section of the site column corresponding to the crop which does not appear on the label (for example, vegetables). Post-harvest stubble use is dealt with similarly. Thus, all claimed uses for a specific site are presented together.
4. The Equipment column covers application equipment appearing on all product labels listing all possible application equipment for the specific site. All aerial applications are restricted uses and in bold text.
5. Cumulative rate per year, maximum number of applications per year and minimum interval between applications: This information is currently specified for use on fruit tree, berry and vine crops but is not clearly specified for other uses such as agricultural cropland and non-cropland. For agricultural cropland use, crops can, in theory, be treated with glyphosate at each of four windows: pre-planting, in-crop spot, pre-harvest and/or post-harvest. Typically, only one application at most is made at each application window. However, the product labels also state that a repeat treatment is required if heavy rainfall occurs immediately after application. In a growing season, it is possible to do sequential applications at some or all application windows, in other words: prior to planting + in-crop spot + pre-harvest + post-harvest stubble. For forestry and non-cropland use, the product labels state that repeat applications may be necessary to control late germinating weeds, regeneration from underground parts or seeds, and new growth or second flush of weeds germinating from the canopy closure.
   In addition, for wiper applications, the product labels state that best results may be obtained if two applications are made in opposite directions. The cumulative product rate per year is expressed to reflect the possible repeat application required if heavy rainfall occurs immediately after application. The cumulative a.i. rate per year, maximum number of applications per year and minimum interval between applications for a specific site are expressed to reflect all possible applications across the growing season, representing the worst case scenario.

Appendix IIb Registered Domestic Class Uses of Glyphosate in Canada as of 23 October 2012. Uses from Discontinued Products or Products with a Submission for Discontinuation are Excluded.[1]

Appendix III Toxicity Profile and Endpoints for Health Risk Assessment

Table III.1A Summary of Toxicology Studies for Glyphosate Acid

Note: Effects noted below are known or assumed to occur in both sexes unless otherwise noted; in such cases, sex-specific effects are separated by semi-colons. Effects on organ weights are known or assumed to reflect changes in absolute weight and relative (to body weight) weight unless otherwise noted.

Study Type/ Animal/ PMRA #	Study Results
Toxicokinetic Studies	
Single Dose (Gavage or IV) F344 Rat PMRA#: 2391579	**Absorption**: Peak blood radioactivity levels were reached within 1st and 2nd hours of oral administration for the low and high-dose groups, respectively. The peak blood radioactivity level was about 0.20% of the administered dose (AD) for the low oral dose and about 0.70% of the AD for the high oral dose. The 10-fold increase in the oral dose resulted in a 35-fold increase in the peak blood concentrations. The blood radioactivity versus time plot fit a two-compartment model with a rapid distribution phase of 30 minutes and slower elimination phase of 13 hours. Blood radioactivity levels declined rapidly following an intravenous dose of 5.6 mg/kg such that within 6 hours of dosing, over 90% of radioactivity was recovered in the urine. Comparison of the pattern of elimination following i.v. and oral administration of ^{14}C glyphosate suggested that the compound was incompletely absorbed. **Distribution**: Most of the radioactivity levels in the tissues were recovered in the gastrointestinal (GI) tract (mostly in the small intestine) up to the 12-hour time point following single oral administration of the low and high doses. Radioactivity was also detected in the liver, kidneys, skin and blood, but in comparably small amounts to the small and large intestines (0.1-0.7% of AD in these tissues and at different time-points). The tissue radioactive residues decreased from 12% of total radioactivity to less than 1% within 24 hours. **Excretion**: Following oral administration of ^{14}C-glyphosate, elimination was similar in the low and high-dose groups although a higher percentage (58-74%) of radioactivity excreted through the feces and a lower portion (~ 35%) excreted through the urine. The fecal excretion peaked towards the end of the measurement (72-hour time point) for both dose groups. The urinary excretion of the radioactivity plateaued at 12 hours in the low-dose group and at 72 hours in the high-dose groups. Following the intravenous administration of a low dose (5.6 mg/kg) of ^{14}C-glyphosate, the elimination was rapid (90% excreted within 6 hours) and occurred primarily through the urine.
Single Dose (IP) Sprague-Dawley Rat PMRA#: 2391580	**Metabolism**: The major radioactive excreted component was unchanged glyphosate. **Excretion**: feces (6-14%), urine (74-78%) after 5 days, negligible excretion via air. Tissue retention at 120 hrs was 1%.
Single Dose (Gavage) Wistar Rat PMRA#: 1184961	**Absorption**: Rapidly absorbed **Metabolism**: The major radioactive excreted component was unchanged glyphosate. 6.9 to 8.6% of AD in feces extracts corresponded to Aminomethylphosphonic acid (AMPA) **Excretion**: in urine (14% in ♂, 35-40% in ♀) and feces (81% in ♂) after 48hrs, negligible excretion via air.

Study Type/ Animal/ PMRA #	Study Results
Single Dose (Gavage) Wistar Rat PMRA#: 1212026	**Absorption**: Incomplete (based on increased rapid fecal excretion) **Distribution**: Autoradiograms showed greater intensity of the radioactivity in bones and kidneys (reducing to negligible amounts by 48 hrs in kidneys.) **Excretion**: In urine (17.9% in ♂, 12.8% in ♀) and feces (59.3% in ♂, 80.3% in ♀) after 24 hours. In urine (34% in ♂, 12.5% in ♀) and feces (60.5% in ♂, 91.2% in ♀) after 48 hours. Radioactivity recovered in the expired air was negligible.
Single Dose (Gavage) Wistar Rat PMRA#: 1212027	**Absorption**: Incomplete (based on increased rapid fecal excretion) **Distribution**: Less than 0.19/0.17% in ♂/♀ of AD present in the GI tract after 72 hrs. Tissue concentrations accounted for 0.5% of AD. Highest concentrations were in bone, liver, kidneys and lungs. **Excretion**: About 90% excreted within 24 hrs of dosing. In urine (13% in ♂, 11% in ♀) and feces (88.5% in ♂, 89% in ♀) after 72 hours
Single Dose (Gavage) Wistar Rat PMRA#: 1212028	**Absorption**: Incomplete (based on increased rapid fecal excretion) **Distribution**: Less than 0.12% of AD present in the GI tract after 72 hrs. Tissue concentrations accounted for 0.5% of AD. Highest concentrations were in bone, liver, and kidneys. **Excretion**: About 90% excreted within 24hrs of dosing. In urine (11% in ♂, 11% in ♀) and feces (87% in ♂, 91% in ♀) after 72 hours
Single Dose (Gavage) Wistar Rat PMRA#: 1212029	**Absorption**: Based on excretion and tissue distribution, the extent of absorption of an oral dose of glyphosate did not exceed 21%. **Distribution**: Tissue concentrations were not examined in this study. **Metabolism**: Poor metabolism since the parent (unchanged) compound excreted in the urine. **Excretion**: Unchanged glyphosate acid with < 1% AMPA in urine. Unchanged glyphosate acid in feces 1000 mg/kg bw bile duct cannula dose: in urine (20.8% in ♂, 16.3% in ♀) and feces (39.1% in ♂, 30.5% in ♀), bile (0.06% in ♂ and ♀) after 48 hrs. 1000 mg/kg bw: in urine (16.0% in ♂, 16.7% in ♀) and feces (79.3% in ♂, 63.9% in ♀) 10 mg/kg bw after 14 unlabelled doses: in urine (10.5% in ♂, 10.5% in ♀) and feces (52.9% in ♂, 72.1% in ♀) 10 mg/kg bw: in urine (12.7% in ♂, 10.5% in ♀) and feces (74.8% in ♂, 55.2% in ♀)
Single Dose (Gavage) Wistar Rat PMRA#: 1212031	**Absorption**: higher in fasted vs. non-fasted animals based on urinary and fecal radioactivity levels **Distribution**: The residues in carcass accounted for 2% of the dose in fasted and 0.5% in non-fasted animals. The residues in GI tract were 0.23% in fasted and 0.13% in non-fasted animals. **Excretion**: in urine (fasted: 51%, non-fasted: 15%) and feces (fasted: 47%, non-fasted: 85%)
Single Dose (IV) Wistar Rat PMRA#: 1212032	**Distribution**: Around 3% of radioactivity was recovered in all tissues that included in decreased order of concentration: bone, spleen, kidneys, lungs, liver, GI tract and salivary glands. **Excretion**: in urine (88.3% in ♂, 74.6% in ♀) and feces (5.1% in ♂, 14.2% in ♀) after 72 hours
Single Dose (Gavage)	**Absorption**: Incomplete (based on increased rapid fecal excretion) **Distribution**: Tissue concentration of radioactivity was low (accounted for less than 0.6% of

Study Type/ Animal/ PMRA #	Study Results
Wistar Rat PMRA#: 1212033	the AD). Highest concentration in bone > kidneys > liver > lungs > spleen > salivary glands > brain. **Excretion**: Over 87% excreted within 24 hrs. Excretion in urine (17% in ♂, 17.5% in ♀) and feces (90% in ♂, 84.5% in ♀) after 72 hours.
Single Dose (Gavage or IV) Non-guideline Wistar Rat PMRA#: 2391577	**Absorption**: Glyphosate was slowly and poorly absorbed orally. The absorption half-life was 2.29 hours while the maximal plasma concentration was 4.64 µg/ml and time to maximal plasma concentration was 5.16 hrs after the oral administration of glyphosate. The oral bioavailability of glyphosate was 23.21%. **Metabolism**: Not extensively metabolized in rats. AMPA was the main metabolite which represented 6.49% of the parent plasma concentrations. **Distribution**: After IV administration of 100 mg/kg bw, the distribution phase of glyphosate was fast ($T_{1/2\alpha}$ = 0.345 hr) and with a high volume of distribution at steady state (V_{ss} = 2.99 L/kg) suggesting extensive distribution in extravascular tissues. The two compartment model was the best fit for both groups to establish the toxicokinetic characteristics. The values of apparent volume of distribution in the second compartment were 2.39 and 2.32 L/kg after IV and oral administration, respectively. **Elimination**: The rate of elimination of AMPA ($T_{1/2\beta}$ = 15.08 hr) after oral glyphosate administration was similar to that of glyphosate ($T_{1/2\alpha}$ = 14.38). The elimination half-life calculated after IV administration was 9.99 hours. The elimination half-life of glyphosate increased by 44% (to 14.38 hr) after oral administration compared to the IV administration.
14-Day Toxicokinetic (Diet) Wistar Rat PMRA#: 1182530 or 1184946	**Absorption**: Poor (based on increased rapid fecal excretion) **Distribution**: The body load (= cumulative intake – cumulative excretion) < 5% of the AD for low and high-dose groups (mid-dose group calculation resulted in a negative value). Maximum concentration levels reached in tissues by 10th day of exposure. Tissue concentration: kidney, spleen > fat > liver > ovaries > heart > muscle > brain > testes (the trend in all dose groups). **Excretion**: Rate of excretion in urine and feces equalled the rate of intake by day 6-8 (indicating a plateau/steady state level had been reached). Mean urinary excretion was 8.3%, 10.5% and 8.5% of the AD for low, mid- and high-dose groups by the end of the treatment. Fecal excretion was over 90% of the AD for each dose group. The urinary excretion had decreased by 96% two days after cessation of the treatment. The fecal excretion was negligible four days after treatment was stopped.
Single Dose (Gavage) NZW Rabbits PMRA#: 1184958, 1184959	**Metabolism**: The major radioactive excreted component was unchanged glyphosate **Distribution**: Highest in gut (2.5%) followed by liver, kidney, spleen, heart, muscles, and gonads. **Excretion**: Feces (80 %), urine (7-10%) after 5 days, negligible excretion via air.
Acute Toxicity Studies	
Acute Oral Toxicity (Gavage) SPF Mice PMRA#: 1161775	LD_{50} > 2000 mg/kg bw **@ 2000 mg/kg bw**: ↑ piloerection and sedation shortly noted after treatment but returned to normal after 24 hours. **Low acute toxicity**
Acute Oral Toxicity (Gavage)	LD_{50} = 5600 mg/kg bw

Study Type/ Animal/ PMRA #	Study Results
Wistar Rat PMRA#: 1184851	**≥ 2500 mg/kg bw:** ↑ piloerection, ↑ lethargy (persisted up to 7 days after dosing), ↑ pale liver and kidneys (animals which died), ↑ ataxia, ↑ convulsions, ↑ muscle tremors, ↑ red nasal discharge, ↑ clear oral discharge, ↑ urinary staining of the abdomen, ↑ soft stool, ↑ fecal staining of the abdomen **Low acute toxicity**
Acute Oral Toxicity (Gavage) Wistar Rat PMRA#: 1161752	LD_{50} > 5000 mg/kg bw **@ 5000 mg/kg bw:** ↑ diarrhea noted on day 2 **Low acute toxicity**
Acute Oral Toxicity (Gavage) Wistar Rats PMRA#: 1211998	LD_{50} > 5000 mg/kg bw **Low acute toxicity**
Acute Oral Toxicity (Gavage) Wistar Rats PMRA#: 1874174	LD_{50} > 5000 mg/kg bw **@ 5000 mg/kg bw:** 1♀ exhibited laboured breathing on day 4 and 6 after treatment **Low acute toxicity**
Acute Oral Toxicity (Gavage) Rabbits PMRA #: 1184695	LD_{50} = 3800 mg/kg bw **≥ 2000 mg/kg bw:** ↑ hypoactivity **≥ 3000 mg/kg bw:** ↑ mortality, ↑ hemorrhage and ulceration of the stomach **Low acute toxicity**
Acute Dermal Toxicity Sprague-Dawley Rats PMRA#: 1161756	**Supplemental** LD_{50} > 2000 mg/kg bw **@ 2000 mg/kg bw**: Piloerection and reduced activity. Scab formation @ the test site 2-14 days after dosing. **Low acute toxicity**
Acute Dermal Toxicity Wistar Rats PMRA#: 1211999	LD_{50} > 2000 mg/kg bw **@ 2000 mg/kg bw:** One male showed slight erythema on days 2 and 3 and one female had scabs from days 3 to 8. **Low acute toxicity**
Acute Dermal Toxicity Wistar Rats PMRA#: 1874176	LD_{50} > 2000 mg/kg bw **Low acute toxicity**
Primary Dermal Irritation	**Supplemental**

Study Type/ Animal/ PMRA #	Study Results
NZW Rabbit PMRA#: 1161763	**Non irritating**
Primary Dermal Irritation NZW Rabbit PMRA#: 1212002	**Non irritating**
Primary Dermal Irritation NZW Rabbit PMRA#: 1874186	**Non irritating**
Dermal Sensitization Hartley Guinea Pig PMRA#: 2391580	**Negative**
Dermal Sensitization ♀ Guinea Pigs PMRA#: 1161765	**Negative**
Dermal Sensitization ♀ Guinea Pigs PMRA#: 1212003	**@ 75% w/v prep:** animals showed scattered mild redness (considered skin irritation) **Negative**
Dermal Sensitization Guinea Pigs PMRA#: 1874187	**Negative**
Primary Eye Irritation Study Rabbit PMRA#: 1184853	Unwashed eyes: 5 showed conjunctival redness, one showed chemosis, one eye showed conjunctival necrosis, one eye showed corneal opacity and ulceration. Washed eyes: 2/3 show corneal opacity and ulceration, conjunctival redness and chemosis. The effects cleared by Day 7. **Mildly irritating**

Study Type/ Animal/ PMRA #	Study Results
Eye Irritation NZW Rabbit PMRA#: 1161760	**Supplemental** One rabbit was tested first and observed 1 hour after instillation. As severe irritation characterized by conjunctival redness and chemosis, corneal opacity, discharge were noted, other animals were not tested. **Severely irritating**
Eye Irritation NZW Rabbit PMRA#: 1161761	**Supplemental** Iritis and moderate conjunctival redness and chemosis **Moderately irritating**
Eye Irritation NZW Rabbit PMRA#: 1212001	Corneal effects included slight to mild opacity affecting up to the entire cornea (seen in all animals during first two days). Conjunctival effects included slight to moderate redness, slight to moderate chemosis and slight to severe discharge noted in all animals up to day 4. Additional observations included mucoid discharge, eye closed, irregular corneal surface, convoluted eyelids, and erythema of the upper and/or lower eyelids, raised corneal opacity, Harderian gland discharge and nictitating membrane partially hemorrhagic. **Moderately irritating**
Eye Irritation NZW Rabbit PMRA#: 1874178	Slight conjunctival redness (MIS = 1.67) and chemosis (MIS = 0.67 to 1.33) were observed. **Minimally irritating**
Acute Inhalation Toxicity (Head only) Sprague-Dawley Rat PMRA#: 1161758	**Supplemental** LC_{50} > 4.98 mg/L **Low acute toxicity**
Acute Inhalation Toxicity (Nose-only) Wistar Rat PMRA#: 1212000	LC_{50} > 4.27 mg/L ≥ 2.43 mg/L: ↑ hunched posture, ↑ piloerection, ↑ wet fur, ↑ breathing irregularities, ↑ reduced righting reflex, ↑ shaking, ↑ splayed gait @ 4.27 mg/L: ↑ mortality (2/5 ♂ and 2/5 ♀) **Low acute toxicity**
Acute Inhalation Toxicity (Head only) Wistar Rat PMRA#: 1874177	LC_{50} > 2.15 mg/L **Low acute toxicity**

Study Type/ Animal/ PMRA #	Study Results
Short-Term Toxicity Studies	
90-Day Oral Toxicity (Diet) CD-1 Mouse PMRA#: 1161787	**Supplemental** **≥ 935/939 mg/kg bw/day:** ↑ incidence of cortical tubular epithelial hypertrophy (*adaptive and not clearly dose-responsive*) Parotid and sublingual salivary glands were not examined. Collection of small plasma volumes affected hematology and clinical chemistry analysis.
90-Day Oral Toxicity (Diet) B6C3F$_1$ Mouse PMRA#: 2391579	NOAEL = 507 mg/kg bw/day (♂) NOAEL = 753 mg/kg bw/day (♀) No treatment-related effect on food consumption, sperm counts, morphology and motility, or estrual cycle length. **≥ 507/753 mg/kg bw/day:** ↑ right kidney wt, ↑ lungs wt (♂) **≥ 1065/1411 mg/kg bw/day**: ↑ incidence and severity of cytoplasmic alterations of the parotid salivary gland; ↑ heart wt (♂)
28-Day Oral Toxicity (Diet) Sprague-Dawley Rat Range-finding PMRA#: 1161768	**≥ 255/277 mg/kg bw/day:** ↑ ALT; ↑ ALP, ↑ phosphate (♂); ↑ mineral deposits at the corticomedullary junction in the kidneys (2/5 [1 very mild, 1 mild], 2/5 [1 very mild, 1 mild], 4/5 [2 very mild, 2 mild] @ top three doses respectively) (♀) **≥ 1034/1047 mg/kg bw/day:** ↓ BWG; ↑ WBC, ↑ lymphocytes (♂); ↓ BW, ↑ ALP, ↓ adrenals wt (♀) **@ 2592/2614 mg/kg bw/day:** ↑ incidence of soft feces , ↓ BW, ↓ adrenals wt (♂); ↓ pChE (♀) Salivary glands were not examined.
28-Day Oral Toxicity (Diet) Wistar Rat Range-finding PMRA#: 1212041	**≥ 100 mg/kg bw/day:** ↓ BW (♂) **≥ 250 mg/kg bw/day:** ↑ ALP; ↑ ALT (♂); ↓ urinary pH, ↓ FE (♀) **@ 1000 mg/kg bw/day:** ↑ RBC, ↑ platelet, ↑ incidence of hydronephrosis (1/6, 1/6 vs. 0/6); ↓ FC, ↓ FE, ↑ glucose, ↓ abs. brain wt, ↑ rel. testes wt (♂); ↓ BW, ↓ BUN, ↓ kidney wt (♀)
90-Day Oral Toxicity (Diet) F344 Rats PMRA#: 2391579	NOAEL = ND LOAEL = 205 mg/kg bw/day (♂) LOAEL = 213 mg/kg bw/day (♀) **≥ 205/213 mg/kg bw/day:** ↑ ALP, ↓ thymus wt, ↑ incidence and severity of cytoplasmic alterations of the parotid and submandibular salivary glands **≥ 410/421 mg/kg bw/day:** ↑ ALT (♂) **≥ 811/844 mg/kg bw/day:** ↑ Hct, ↑ RBC, ↓ sperm counts (10-20%) (♂) **≥ 1678/1690 mg/kg bw/day**: ↓ BW, ↓ BWG, ↑ bile acids; ↑ rel. liver wt, ↑ rel. right kidney wt, ↑ rel. right testicle wt, ↑ Hgb (♂) **@ 3393/3939 mg/kg bw/day:** ↑ incidence of diarrhea, ↓ FC; ↑ platelet, ↓ abs. heart wt (♂); ↑ lymphocytes, ↑ WBC, ↑ MCH, ↑ MCV, ↑ rel. right kidney wts, ↑ estrous cycle length (5.4 days vs. 4.9 days) (♀)

Study Type/ Animal/ PMRA #	Study Results
90-Day Oral Toxicity (Diet) Sprague-Dawley Rat PMRA#: 1161777	NOAEL = ND LOAEL = 30 mg/kg bw/day (♂) LOAEL = 31 mg/kg bw/day (♀) **≥ 30/31 mg/kg bw/day**: ↑ incidence and severity of cellular alterations of the parotid salivary gland
90-Day Oral Toxicity (Diet) Wistar Rat PMRA#: 1212004 and 1410983	NOAEL = 414 mg/kg bw/day (♂) NOAEL = 1821 mg/kg bw/day (♀) **≥ 81/90 mg/kg bw/day:** ↑ ALT, ↑ ALP; ↑ prothrombin time, ↓ platelet count (♂) (*non-adverse*) **≥ 414/447 mg/kg bw/day**: ↓ platelet count (♀) (*non-adverse*) **@ 1693/1821 mg/kg bw/day:** ↓ BUN; ↓ BW, ↓ BWG, ↓ FE, ↓ triglycerides, ↓ plasma total protein, ↓ heart wt, ↓ liver wt (♂); ↑ AST (♀) Salivary glands were not examined.
21-Day Dermal Toxicity Sprague-Dawley Rat PMRA#: 1161790	LOAEL (irritation) = 1000 mg/kg bw/day LOAEL (systemic) = 1000 mg/kg bw/day **@ 1000 mg/kg bw/day**: ↑ very slight erythema (♂: 2/5, ♀: 3/5 during wk 2, only 1/5 ♀ showed this effect during wk 3), ↑ desquamation (♂: 3/5 moderate to severe, ♀: 5/5 mild to severe during wk 2, 1/5 in each of ♂ and ♀ during wk 3 with mild severity grading; 1/5 ♀ thickening and severe desquamation during wk 3); ↑ unilateral dilatation of the kidneys (2/5 vs. 0/5), ↑ unilateral papillary necrosis (1/5 vs. 0/5), ↑ urothelial hyperplasia (2/5 vs. 0/5), ↑ pelvic dilation (3/5 [severity grade: +, ++, +++] vs. 0/5) (♂)
21-Day Dermal Toxicity Wistar Rat PMRA#: 1212007	NOAEL (irritation) ≥ 1000 mg/kg bw/day NOAEL (systemic) ≥ 1000 mg/kg bw/day Not systemic or dermal irritation effect
21-Day Dermal Toxicity NZW Rabbit PMRA#: 2443653	NOAEL (irritation) = 1000 mg/kg bw/day NOAEL (systemic) ≥ 5000 mg/kg bw/day No systemic toxicity (no treatment-related effect on BW, hematology, clinical chemistry, organ weights, or histopathology) **@ 5000 mg/kg bw/day:** ↑ slight dermal irritation (erythema and edema on intact and abraded skin of both sexes); ↓ FC (♀)
90-Day Oral Toxicity (Diet) Beagle Dog PMRA#: 1184795	**Supplemental** No treatment-related effect on BW, hematology, clinical organ weights, or histopathology
90-Day Oral Toxicity (Diet) Beagle Dog PMRA: 1212005	NOAEL = 323 mg/kg bw/day (♂) NOAEL = 334 mg/kg bw/day (♀) **≥ 68/68 mg/kg bw/day**: ↑ abs. adrenals wt, ↑ liver wt (♂) (*non-adverse*) **≥ 323/334 mg/kg bw/day**: ↑ creatine kinase, ↑ kidneys wt (♂) (*non-adverse*) **@ 1680/1750 mg/kg bw/day:** ↓ BWG; ↓ RBC, ↓ albumin, ↓ total protein, ↓ [Ca^{++}], ↓ [K^{+}] (♂);

Neurotoxicity Studies	
Acute Neurotoxicity (Gavage) Wistar Rat PMRA#: 1212034	NOAEL = 1000 mg/kg bw/day (♂/♀) No treatment-related effect on landing foot splay, time to tail flick, grip strength data and motor activity habituation **≥ 1000 mg/kg bw/day**: ↓ motor activity **@ 2000 mg/kg bw/day**: ↑ incidence of clinical signs of toxicity/FOB findings (♂: ↑ reduced splay reflex, ♀: decreased activity, subdued behaviour, hunched posture, sides pinched in, tip-toe gait, reduced splay reflex and/or hypothermia for three females including the one died on day 2 and diarrhea for one further female 6hrs after dosing and full recovery by day 2, abnormal respiratory noise in another female on day 2), ↓ FC, ↓ motor activity; one death (♀) **No evidence of neurotoxicity**
90-Day Neurotoxicity (Diet) Wistar Rats PMRA#: 1212037	NOAEL = 617 mg/kg bw/day (♂) NOAEL = 672 mg/kg bw/day (♀) **≥ 617/672 mg/kg bw/day**: ↓ BWG, ↓ FE **@ 1546/1631 mg/kg bw/day**: ↑ decreased pupillary response to light, ↓ BW (♂); ↓ BWG, ↓ motor activity (♀) **No evidence of neurotoxicity**
Immunotoxicity Studies	
28-Day Immunotoxicity (Diet) $B6C3F_1$ Mouse PMRA#: 2223081	LOAEL = 150 mg/kg bw/day No treatment-related effects on spleen or thymus weights (absolute or relative) **≥ 150 mg/kg bw/day**: ↑ T-cell dependent antibody response as measured by IgM AFC/10^6 spleen cells, ↑ total spleen activity as measured by IgM AFC/spleen × 10^3 **Evidence of immunotoxicity**

Study Type/ Animal/ PMRA #	Study Results
Special Studies (non-guideline)	
14-Day Feeding Mechanistic Study (Induction of salivary gland lesions) F334 ♂ Rats PMRA#: 2391579	Softer and wetter feces were noted in glyphosate fed groups. Decrease in body-weight gains in the glyphosate-fed groups was noted compared to the other groups. Absolute parotid weight was increased in the group 2 (glyphosate-fed), group 3 (glyphosate-fed + propranolol), and group 4 (isoproterenol) compared to group 1 (control). Absolute submandibular/sublingual was increased in group 2, group 3, and group 4. Increased incidence of lesions in the parotid gland was observed in the in all groups compared to group 1 (control). Increased incidence of lesions was also observed in the submandibular gland of the groups 2 (glyphosate + vehicle) and 3 (glyphosate + propranolol) animals. Parotid lesions consisted of cytoplasmic basophilic change, fine vacuolation, and swelling of acinar cells, diagnosed collectively as cytoplasmic alterations. A distinct gradation in the severity of these lesions was reported which was based on the extent of involvement and degree of tinctorial alteration and cell enlargement present.
28-Day Oral Toxicity Study (Diet): Glyphosate Acid: Comparison of salivary gland effects in three strains of rat Wistar Rat Sprague-Dawley Rat Fischer 344 Rat PMRA #: 1212038	**Wistar Rats** **@ 1000 mg/kg bw/day:** ↓ BW (complete recovery after the 13th week recovery period), ↓ FC, ↑ salivary gland wt, ↑ salivary gland effect (small foci of cells). ↑ mucous metaplasia of parotid **Sprague-Dawley Rats** **@ 1000 mg/kg bw/day:** ↓ BW (complete recovery after the 13th week recovery period), ↓ FC, ↑ salivary gland effect (small foci of cells). **Fischer Rats**: **@ 1000 mg/kg bw/day:** ↑ salivary gland wt, ↑ pronounced salivary gland effect (diffuse cytoplasmic basophilia and enlargement of the parotid acinar cells). **Recovery Periods** Complete recovery in Wistar and SD rats starting after 4 weeks of recovery period from treatment-related effects. Starting after 4 weeks of recovery period, all treatment-related effects improved, but did not disappear in F344 rats, (focal changes in the salivary glands and increased salivary gland weight was evident).

Table III.1B Summary of Toxicology Studies for AMPA

NOTE: Effects noted below are known or assumed to occur in both sexes unless otherwise noted; in such cases, sex-specific effects are separated by semi-colons. Effects on organ weights are known or assumed to reflect changes in absolute weight and relative (to bodyweight) weight unless otherwise noted.

Study Type/ Animal/ PMRA #	Study Results
Toxicokinetic Studies	
Toxicokinetic Single dose (Gavage) ♂ Wister Rats PMRA# 1184960	**Absorption**: Rapid (20%) **Distribution**: ≤ 0.01% of dose in most tissue, 0.02% in muscle and gut after 120 hrs (single dose) **Metabolism**: None since the compound was excreted in the unchanged form **Excretion**: Within 120 hr, 94% of administered dose (AD) was excreted as unchanged compound. 74% via the feces, 20% via the urine. < 0.1% excreted in the exhaled air, and < 0.06% was identified in the carcass.
Acute Toxicity Studies	
Acute Oral Toxicity Sprague-Dawley Rats PMRA#: 2391580	LD_{50} = 8300 mg/kg bw **Low acute toxicity**
Acute Oral Toxicity Wistar rats PMRA# 1212035	LD_{50} ≥ 5000 mg/kg bw Clinical signs included diarrhea, stains around the nose, lack of grooming, piloerection, and urinary incontinence (recover by 3-4 days post dosing). **Low acute toxicity**
Acute Oral Toxicity (Limit Dose) Sprague-Dawley Rats PMRA#: 1161753	LD_{50} > 5000 mg/kg bw Clinical signs 4h-3days post-dosing included piloerection, diarrhea, subdued behaviour, hunched appearance, and soiled anal and peri-genital areas. **Low oral toxicity**
Primary Eye Irritation Rabbits (Albino) PMRA#: 2391580	**Minimally Irritating**
Primary Dermal Irritation Rabbits (Albino) PMRA#: 2391580	**Non irritating**

Study Type/ Animal/ PMRA #	Study Results

Table III.2 Toxicological Points of Departure for Use in Human Health Risk Assessment for Glyphosate Acid, AMPA, N-acetyl glyphosate and N-acetyl AMPA

	RfD	Study NOAEL (or LOAEL)	CAF or Target MOE and Rationale
ARfD (General Population)	1.0 mg/kg bw	NOAEL = 100 mg/kg bw/day **Rabbit developmental toxicity study** (Increased incidence of diarrhea: few/no feces, staining in genital area.)	CAF = 100 PCPA factor[1] = 1-fold
ARfD (female 13-49 years of age)	0.5 mg/kg bw	NOAEL = 150 mg/kg bw/day (for fetal cardiovascular malformations) **Rabbit developmental toxicity study** (Increased incidence of fetal cardiovascular malformations.)	CAF = 300 PCPA factor = 3-fold

	RfD	Study NOAEL (or LOAEL)	CAF or Target MOE and Rationale
ADI (All Populations)	0.3 mg/kg bw/day	NOAEL = 32/34 mg/kg bw/day (♂/♀) **26-month Chronic/Carcinogenicity Study in Rats** (No treatment-related effects were noted in this study. This was the highest (combined) NOAEL for the long-term toxicity studies in rats. The lowest (conbined) LOAEL was 100 mg/kg bw/day based on reduction in body weight in male rats in the interim sacrifice and increased incidences and severity of cellular alterations in the parotid and submandibular glands in a 24-month chronic toxicity and carcinogenicity study in rats. NOAELS/LOAELs are further supported by the NOAEL of 30 and LOAEL of 100 mg/kg bw/day in one-year studies in dogs.)	CAF/MOE = 100 PCPA factor = 1-fold
Aggregate (All Durations and Populations)			Target MOE = 100
Incidental Oral, Short-term Dermal and Inhalation (All Populations)	0.3 mg/kg bw/day	LOAEL = 30 mg/kg bw/day **90-Day Oral Study in Rats** (Increased incidence and severity of cellular alteration in the parotid gland. This LOAEL was considered to be at the threshold of toxicological adversity due to the mild nature of the cellular alteration in the parotid glands at this dose level. As a result, an uncertainty factor (UF_L) for extrapolating from a LOAEL to a NOAEL was not deemed necessary.)	Target MOE = 100
Intermediate and Long-term dermal, Inhalation, (All Populations)	0.3 mg/kg bw/day	NOAEL = 32/34 mg/kg bw/day (♂/♀) **26-month Chronic/Carcinogenicity Study in Rats** (No treatment-related effects were noted in this study. This was the highest (combined) NOAEL for the long-term toxicity studies in rats. The lowest (combined) LOAEL was 100 mg/kg bw/day based on reduction in body weight in male rats in the interim sacrifice and increased incidences and severity of cellular alterations in the parotid and submandibular glands in a 24-month chronic toxicity and carcinogenicity study in rats. NOAELS/LOAELs are further supported by the NOAEL of 30 and LOAEL of 100 mg/kg bw/day in one-year studies in dogs.)	Target MOE = 100
Cancer Assessment		Low level of concern due to benign nature of tumours observed at the limit dose and lack of oncogenicity in other studies	

[1] PCPA factor = *Pest Control Products Act* factor

Appendix IV Dietary Exposure and Risk Estimates for Glyphosate

Table IV.1 Dietary Exposure and Risk Estimates for Glyphosate

Population Subgroup	MRL/Tolerance-Level							
	Acute Dietary (95th percentile)[1]				Chronic Dietary[2]			
	Food Only		Food + Water		Food Only		Food + Water	
	Exposure (mg/kg/day)	%ARfD	Exposure (mg/kg/day)	%ARfD	Exposure (mg/kg/day)	%ADI	Exposure (mg/kg/day)	%ADI
General Population	—	—	—	—	0.090925	28	0.095078	30
All Infants (< 1 year old)	0.310861	31	0.344347	34	0.125494	39	0.139108	44
Children 1-2 years old	**0.435005**	**44**	**0.446406**	**45**	**0.218341**	**68**	**0.224507**	**70**
Children 3-5 years old	0.401028	40	0.411654	41	0.213099	67	0.218872	68
Children 6-12 years old	0.283779	28	0.289644	29	0.147290	46	0.151272	47
Males[3] 13-19 years old	0.207897	21	0.210659	21				
Youth[3] 13-19 years old					0.090032	28	0.093034	29
Males[3] 20-49 years old	0.158854	16	0.176746	18				
Adults[3] 20-49 years old					0.073547	23	0.077423	24
Adults 50+ years old	0.116579	12	0.123514	12	0.058796	18	0.062875	20
Females 13-49 years old	0.146629	29	0.152714	31	0.068430	21	0.072290	23

[1]Acute reference dose (ARfD) of 0.5 mg/kg bw applies to females 13-49 years old; ARfD of 1.0 mg/kg bw applies to population subgroups other than females 13-49 years old.

[2]Acceptable daily intake (ADI) of 0.3 mg/kg bw/day applies to the general population and all population subgroups.

[3]Due to a specific ARfD for females 13-49 years old, acute exposure and risk estimates for males 13-19 and 20-49 years old were calculated separately by using the appropriate ARfD. Acute exposure and risk estimations for youth 13-19 years old and adults 20-49 years were not applicable. This separation was not necessary for chronic exposure and risk estimations as the same ADI applies to all population subgroups.

Appendix V Food Residue Chemistry Summary

V.1 Metabolism

V.1.1 General Considerations

Previously reviewed comparative studies have shown that there are no significant differences in the behaviour of aqueous solutions of glyphosate prepared from the acid form (in other words, technical glyphosate) and the different salts of glyphosate (for example, isopropylamine, ammonium or trimethylsulfonium salt). In these aqueous solutions, the glyphosate anion (in other words, the phosphonomethylglycine anion, denoted as PMG) and the cationic counterion exist as freely dissociated ions. Thus, with regard to the metabolic fate of the PMG moiety, all the glyphosate forms are considered to be equivalent when using ^{14}C-PMG radiolabelled material. The metabolism of the counterion is studied by using ^{14}C-counterion labelled test compound.

V.1.2 Animal Metabolism

Glyphosate

Livestock (goats and hens) metabolism studies were conducted with ^{14}C-PMG or ^{14}C-TMS labelled glyphosate salts. TMS (trimethylsulfonium) is the cationic group of glyphosate-TMS, the trimethylsulfonium salt of glyphosate. The studies were previously reviewed and deemed adequate. It was concluded that the biotransformation and degradation pathways of glyphosate (the PMG moiety) in the goat and hen are similar, producing essentially unchanged PMG and aminomethylphosphonic acid (AMPA); these pathways were also found to be similar to those established in rat metabolism.

N-acetylglyphosate

The metabolism of the metabolite *N*-acetylglyphosate, which is formed in the glyphosate *N*-acetyltransferase (GAT) crops (in other words, crops that were genetically modified to express the glyphosate *N*-acetyltransferase gene) treated with glyphosate, was also investigated in goats and poultry. The studies revealed that the molecule *N*-acetylglyphosate either remains unchanged or loses its *N*-acetyl group, forming parent glyphosate. Parent glyphosate is further metabolized into AMPA. To a certain extent *N*-acetyl AMPA was also formed, but was not detected in any tissue except in fat samples at low levels (average: 0.02 ppm in goat; 0.006 ppm in hen). AMPA was detected at low levels in milk, liver, fat, muscle and eggs.

V.1.3 Plant Metabolism

Glyphosate

The nature of glyphosate residues in plants has been investigated in a wide range of non-transgenic (conventional, glyphosate non-tolerant) crops (for example, wheat, grapes, corn, soybean and lemon) and in transgenic (glyphosate tolerant) crops containing the 5-enolpyruvylshikimate-3-phosphate synthase (EPSPS) gene and/or the glyphosate oxidoreductase (GOX) gene (for example, soybean). The studies indicate that the uptake of glyphosate from soil is limited. The material that is taken up is readily translocated. Foliar applied glyphosate is readily absorbed and translocated throughout the trees or vines to the fruits. Conventional and transgenic crops containing EPSPS and/or GOX genes show a similar glyphosate metabolic pattern, producing mainly the parent compound (the PMG moiety) and the metabolite AMPA. However, in glyphosate-tolerant EPSPS/GOX crops, glyphosate was metabolized more rapidly to AMPA. For the most part, the ratio of glyphosate to AMPA is 9 to 1 but can approach 1 to 1 in a few cases (for example, soybeans and carrots).

***N*-acetylglyphosate**

The metabolic fate of ^{14}C-PMG labelled glyphosate has also been investigated in soybean, corn and canola plants genetically modified to express the GAT gene. The studies were previously reviewed and deemed adequate. These studies revealed that, whereas conventional and glyphosate-tolerant crops containing the EPSPS and/or the GOX genes show a similar metabolic pattern that consists mainly of parent compound and AMPA, in crops containing the GAT gene, the major metabolic pathway is different. The parent compound is extensively metabolised to *N*-acetylglyphosate; to a lower extent *N*-acetyl AMPA and AMPA are also formed.

V.1.4 Residue Definition

Based on metabolism studies summarized above, the PMRA has previously determined that the residue definition (RD) in all conventional crops and in transgenic crops containing the EPSPS and/or the GOX genes is comprised of glyphosate and the metabolite AMPA. The RD in genetically modified crops containing the GAT gene (in other words, soybeans, corn and canola) is the sum of glyphosate and the metabolites *N*-acetylglyphosate, AMPA and *N*-acetyl AMPA. The RD in animal commodities is the sum of glyphosate and the metabolites *N*-acetylglyphosate and AMPA. These RDs are used for both enforcement and dietary risk assessment purposes. No modification to the current RDs is proposed as the result of this re-evaluation, provided it is understood that all the metabolites included in the RDs are expressed as glyphosate (see Table VI.1). The residue of concern in drinking water for dietary risk assessment is defined as the sum of glyphosate and the metabolite AMPA. The acetylated metabolites are not included in the RD for drinking water because they are not formed in soil, in other words, *N*-acetylglyphosate is not applied to plants; it is a metabolite produced in GAT crops as a result of the application of glyphosate.

Table V.1 Residue Definitions

Transgenic GAT Crops	Conventional and Transgenic EPSPS/GOX Crops	Animal Commodities	Drinking Water
Residue Definition for Enforcement of MRLs			
Sum of glyphosate, *N*-acetylglyphosate, AMPA and *N*-acetyl AMPA, expressed as glyphosate[1]	Sum of glyphosate and AMPA, expressed as glyphosate[1]	Sum of glyphosate, *N*-acetylglyphosate and AMPA, expressed as glyphosate[1]	Not applicable
Residue Definition for Risk Assessment			
Same as RD for enforcement	Same as RD for enforcement	Same as RD for enforcement	Sum of glyphosate and metabolite AMPA

[1] Molecular weight conversion factors (MWCF) for field trial residues: Glyphosate = 0.8 × *N*-Acetylglyphosate; 1.1 × *N*-Acetyl AMPA; 1.5 × AMPA.

V.2 Analytical Methods

The analysis of glyphosate and its major metabolites is complicated by the polar nature of the residues (in other words, insoluble in most organic solvents) and their similarity in properties to naturally occurring compounds such as amino acids. Nonetheless, several single analyte analytical methods have been reported for the analysis of residues in plant materials, animal tissues, milk and eggs. The methods used in field trials were similar to, or the same as those reported as suitable for enforcement purposes. The methods generally involve aqueous extraction of residues, typically with dilute acid, clean-up on cation and anion exchange columns, separation using GC or high performance liquid chromatography (HPLC) and derivatization prior to detection. The derivatisation reaction varies with the chromatographic method used for separation (GC, HPLC) and detection system employed (FPD, fluorescence detector, UV, MS or MS/MS). Satisfactory recoveries at limits of quantitation (LOQs) in the range of 0.025-0.05 ppm for glyphosate and its major metabolites were reported for numerous commodities. Some of those analytical methods have been successfully validated for enforcement purposes and are listed in United States Environmental Protection Agency’s pesticide analytical methods (PAM)-Volume II or in the index of residue analytical methods (RAM) pending compilation in PAM-Volume II. Multiresidue methods in PAM-Volume I Appendix I were found to be inadequate for enforcement purposes and glyphosate is not listed in CFIA’s Volume 7: Multiresidue Analytical Method Manual.

V.2.1 Supervised Residue Trial Analytical Methodology

Several single analyte analytical methods for the determination of the residues of glyphosate and its metabolites AMPA and the TMS cation in various plant and animal matrices have been previously reviewed and deemed adequate. Successfully validated methods are also available for the determination of glyphosate and its metabolites *N*-acetylglyphosate, AMPA and *N*-acetyl AMPA in GAT-soybean, GAT-corn and GAT-canola and in animal commodities. The analyses were performed using reverse phase HPLC and a tandem LC-MS/MS system operating with an electrospray interface (ESI) in positive ion mode detection. The LOQ in each matrix examined was 0.05 ppm for plant commodities and in the range of 0.025-0.05 ppm for animal commodities.

V.2.2 Enforcement Analytical Methodology

The inter-laboratory validated data collection methods (see Section V.2.1) were determined to be acceptable for the enforcement of glyphosate MRLs including all the metabolites comprised in the residue definitions.

V.2.3 Independent Laboratory Validation (ILV)

See Section V.2.1.

V.2.4 Multi-Residue Analytical Methodology (MRM) Evaluation

Data from the Pestrak database (1990 and 2005) indicate that recoveries are not likely for glyphosate under USFDA PAM I Multiresidue Methods. *N*-acetylglyphosate was also tested according to Protocols A, B and C of the PAM I multiresidue methods. The test substance was not naturally fluorescent according to procedures outlined in Protocol A, and lacked suitable chromatographic properties according to the procedures outlined in Protocols B and C. Therefore, the multiresidue methods described in PAM I are not suitable also for the regulatory analysis of *N*-acetylglyphosate.

V.3 Food Residues

V.3.1 Storage Stability

V.3.1.1 Storage Stability of Working Solutions in Analytical Methodology

The storage stability of working solutions of glyphosate and its metabolites reported as part of the analytical methodology studies (see Sections V.2.1, V.2.2 and V.2.3) was deemed adequate.

V.3.1.2 Freezer Storage Stability

Glyphosate, AMPA – Reports on freezer storage stability of glyphosate and AMPA were previously reviewed for a variety of crops including soybean, soybean straw, wheat grain, sorghum grain, citrus fruits, grapes and bananas. It was concluded that glyphosate and AMPA (plant incorporated) appeared to be stable in the crops for the duration of the magnitude of residue (MOR) studies, which generally did not exceed 48 months. However, it was noted that the stability of AMPA in spiked samples was more matrix dependent, in other words, the residues remained stable in corn grain and tomatoes for up to 31 months, in soybean forage for up to 24 months, in sorghum straw for up to 9 months and in clover for only 6 months.

N-acetylglyphosate, N-acetyl AMPA – When stored at -20ºC, residues of *N*-acetylglyphosate were stable for up to 12 months in soybean forage, seed and hay; corn green plant, forage and grain; and for 23 months in corn stover. Residues of *N*-acetyl AMPA were stable for at least 18 months in soybean forage, seed, and hay and for up to 23 months in corn green plant, forage, grain and stover. These stability periods were deemed adequate to support MOR studies.

V.3.2 Magnitude of Residue Studies

V.3.2.1 Supervised Residue Trial Studies

Conventional and transgenic EPSPS/GOX crops – All data requirements for the magnitude of the residue in conventional and in transgenic EPSPS/GOX plants have been evaluated in past petitions and deemed adequate. The submitted data originated from a number of field trials conducted side-by-side with different glyphosate salt formulations on numerous crops. The data support a maximum seasonal rate of 6.2 kg a.e./ha in pre-emergent applications and 0.9 kg a.e./ha in pre-harvest applications for forage crops (PHI of 3-7 days) and all other crops (PHI of 7-14 days). It was concluded that the magnitude of the residues resulting from application of any of the formulations was comparable.

Transgenic GAT crops – Data on residues of glyphosate, *N*-acetylglyphosate, AMPA and *N*-acetyl AMPA in transgenic GAT-soybean, GAT-corn and GAT-canola support a combined maximum pre-emergent + post-emergent seasonal application rate of 6.98 kg a.e./ha and a PHI of 12-17 days for soybean seeds; 7.22 kg a.e./ha and a PHI of 7 ± 1 days for corn grain; and 2.53 kg a.e./ha and a PHI of 6-8 days for canola seeds.

V.3.2.2 Residue Decline Study

Residue decline studies were conducted concurrently with supervised residue trials. The studies were previously reviewed and deemed adequate to support the PHIs specified on the labels (see Section VI.3.2.1 above).

V.3.2.3 Confined Crop Rotation Trial Study

Confined rotational crop studies conducted with conventional, non-transgenic lettuce (leafy vegetable), wheat (cereal crop) and radish (root vegetable) using ^{14}C-PMG labelled glyphosate-trimesium were previously reviewed.These studies demonstrated similar metabolic pathways in all the studied secondary crops and showed that very low levels of the test compound were taken up by the plants. Similarly to the metabolism of glyphosate in primary crops, PMG and AMPA were the relevant major components of the radioactive residue found in rotational crops. The remaining radioactivity was largely incorporated into natural plant products. The studies were deemed adequate to support glyphosate label claims but no plant back intervals (PBIs) were specified on the labels. The PMRA concluded that, as glyphosate is registered for use as a “prior to planting” application on all crops (including rotated crops), no further plant back restrictions are required. Based on the same study, USEPA also concluded that the current language on glyphosate labels is sufficient with respect to plant back restrictions and that further plant back restrictions were not necessary.

V.3.2.4 Field Crop Rotation Trial Study

Conclusions from Section V.3.2.3 (above) waive the requirement for a field crop rotation trial study.

V.3.2.5 Processed Food/Feed

Processing studies were reviewed with past petitions for residues of glyphosate and AMPA in processed fractions of conventional or transgenic EPSPS/GOX soybean (hulls, meal, crude oil, refined oil, soapstock and aspirated grain fractions), wheat (bran, short, middlings, flour and aspirated grain fractions), barley (malt and beer), and canola (cake and oil). These crops are representative of all pre-harvest uses of glyphosate on crops that can be processed (in other words, soybean, canola, flax, wheat, barley and oats). Processing studies were also previously reviewed for residues of glyphosate, *N*-acetylglyphosate, AMPA and *N*-acetyl AMPA in processed fractions of transgenic GAT-soybean, GAT-corn and GAT-canola. The use of experimental processing factors as a refinement was not necessary at this time; default processing factors were used in the exposure assessment.

V.3.2.6 Residue Data for Crops Used as Livestock Feed

Residue data for crops used as livestock feed have been previously reviewed. The data were used for the establishment of MRLs in animal commodities.

V.3.2.7 Livestock, Poultry, Egg and Milk Residue Data

Dairy cow, laying hen and swine feeding studies conducted with conventional and/or transgenic EPSPS/GOX crops have been previously reviewed and deemed adequate to support MRLs for residues of glyphosate, AMPA and TMS cation in livestock and dairy commodities. As MRLs for residues of the TMS cation are being proposed for revocation (see Section V.4), considerations related to this metabolite are not included in this discussion. Given that GAT crops (soybean, corn and canola) treated with glyphosate may be used as feed, livestock could be exposed not only to glyphosate and AMPA, but also to the new metabolites typical for these genetically modified varieties, namely *N*-acetylglyphosate and *N*-acetyl AMPA. Therefore, based on metabolism studies of *N*-acetylglyphosate in livestock, the residue definition (RD) for both enforcement and risk assessment of glyphosate residues in livestock has been amended in past petitions in order to take into account the possible presence of *N*-acetylglyphosate and *N*-acetyl AMPA. As *N*-acetyl AMPA was found to be a minor component of the residue in animal commodities, the RD was revised from glyphosate and AMPA, to glyphosate and the metabolites *N*-acetylglyphosate and AMPA, expressed as glyphosate. Based on results of livestock feeding studies conducted with GAT crops, the maximum theoretical dietary burden (MTDB) and consequently MRLs in livestock commodities were revised to the current status.

V.4 Data Gaps

Sufficient information was available to adequately assess the dietary exposure and risk from exposure to glyphosate (all registered, equivalent salt formulations). Given that all uses of glyphosate-TMS were voluntarily discontinued, risk assessments for glyphosate-TMS were not conducted. No deficiencies were identified in the residue chemistry database from previous PMRA reviews. No further data are required.

Appendix VI Supplemental Maximum Residue Limit Information, International Situation and Trade Implications

Maximum Residue Limits (MRLs) may vary from one country to another for a number of reasons, including differences in pesticide use patterns and the locations of the field crop trials used to generate residue chemistry data. For animal commodities, differences in MRLs can be due to different livestock feed items and practices.

VI.1 Canadian MRLs for Food Commodities

MRLs have been specified for residues of glyphosate including the metabolite AMPA in/on registered conventional and transgenic EPSPS/GOX genes containing crops as well as for residues of glyphosate including the metabolites *N*-acetylglyphosate, AMPA and *N*-acetyl AMPA in/on transgenic GAT gene containing crops (in other words, corn, canola and soybeans). MRLs have also been specified for residues of glyphosate including the metabolites *N*-acetylglyphosate and AMPA in animal commodities. Separate MRLs have been specified for residues of the TMS cation (resulting from the use of glyphosate-trimesium) in plant as well as in animal commodities. PMRA's decision to regulate the TMS cation (detected as dimethyl sulfide and reported as TMS cation) separately was based on the fact that glyphosate-trimesium demonstrates a higher toxicity profile than the other glyphosate salts and, contrary to the counterions of the latter, the TMS cation is not a naturally occurring compound and leaves residues above the general regulation limit of 0.1 ppm [see Table VI.1]. Residues in/on all other crops appearing on the registered labels are regulated under Subsection B.15.002(1) of the *Food and Drugs Regulations* not to exceed 0.1 ppm (General MRL) for glyphosate (including metabolites) and 0.1 ppm for the TMS cation. Given that all glyphosate-trimesium (GPT) containing products have been discontinued, it is proposed that all MRLs for the TMS cation be revoked.

Table VI.1 Canadian Maximum Residue Limits

Commodity	MRL (ppm)	
	Glyphosate (Including Metabolites)	TMS Cation
Oat milling fractions (excluding flour)	35	15
Rapeseeds (canola)	20	10
Dry soybeans	20	13
Oats	15	10

Meat of cattle, goats, hogs, horses and sheep	0.08	0.5
Meat of poultry	0.08	0.05
Milk	0.08	0.5
Meet byproducts of cattle, goats, hogs, horses and sheep	*	0.5
All other crops appearing on the registered labels	*	*

* Regulated under Subsection B.15.002(1) of the Food and Drugs Regulations not to exceed 0.1 ppm.

VI.2 International Regulatory Status

United States – In the United States, glyphosate is registered for use on a variety of fruit, vegetable and field crops as well as for aquatic and terrestrial non-food uses. Glyphosate is also registered for use on transgenic crop varieties such as canola, corn, cotton, soybeans, sugar beets and wheat. The registered forms of glyphosate include: glyphosate acid; glyphosate, isopropylamine salt; glyphosate, ethanolamine salt; glyphosate, sodium salt; glyphosate, potassium salt; glyphosate, ammonium salt; glyphosate, diammonium salt; and glyphosate, dimethylammonium salt. Glyphosate-trimesium (GPT, in other words, sulfosate or glyphosate-TMS) is not currently included in any pesticide products actively registered in the United States, and is not, therefore, included in the current USEPA registration review program for glyphosate active ingredient. With regard to exposure and risk assessment, the USEPA considers all these active compounds as being equivalent, with glyphosate acid as the common moiety. Tolerances [see Table VI.2] are currently established under 40 CFR §180.364 for:

a) Residues of glyphosate, including its metabolites and degradates in/on registered conventional crops and transgenic EPSPS/GOX crops, resulting from the application of all registered forms of glyphosate. Compliance with those tolerance levels is to be determined by measuring only glyphosate (*N*-[phosphonomethyl] glycine). The USEPA determined that, based on toxicological considerations, the metabolite AMPA need not be regulated regardless of levels observed in food or feeds.

b) Residues of glyphosate, including its metabolites and degradates in/on registered transgenic GAT crops and in animal commodities, resulting from the application of all registered forms of glyphosate. Compliance with those tolerance levels is to be determined by measuring only glyphosate and its metabolite *N*- acetylglyphosate calculated as the stoichiometric equivalent of glyphosate. The metabolite *N*-acetylglyphosate is considered to be equally toxic as glyphosate. The metabolite *N*-acetyl AMPA, which is also formed in transgenic GAT crops, was excluded as residue of concern based on residue and toxicity considerations. However, the USEPA noted that the decision not to regulate AMPA and *N*-acetyl AMPA, regardless of levels observed in foods or feeds, may be revisited during the registration review process.

JMPR/Codex – Codex MRLs have been established in/on a range of plant commodities as well as in commodities of animal origin (see Table VI.2). The residue definitions (RDs) for compliance with MRLs are the same as those used by the USEPA for both transgenic GAT crops (in other words, the RDs exclude the metabolites AMPA and *N*-acetyl AMPA) and for conventional and transgenic non-GAT crops (in other words, the RDs exclude the metabolite AMPA). However, the residue for dietary risk assessment for plant (genetically modified or not) and animal commodities is defined as the sum of glyphosate, *N*-acetylglyphosate, AMPA and *N*-acetyl AMPA, expressed as glyphosate. This RD is the same as the one used by the PMRA for both enforcement of MRLs and dietary risk assessment for transgenic GAT crops. Note that for risk assessment the PMRA excludes the acetylated metabolites from RDs in non-GAT crops (except corn, soybean and canola) as well as *N*-acetyl AMPA from RDs in animal commodities. There are no Codex MRLs for the TMS cation of glyphosate-trimesium.

EU – Glyphosate (including glyphosate-trimesium, in other words, sulfosate or glyphosate-TMS) has been approved for use in EU countries (in other words, is included in Annex I to Council Directive 91/414/EEC) until 12/31/15. The residue definitions for enforcement and risk assessment have recently been amended to accommodate new varieties of genetically modified (in other words, GAT gene-containing) soybeans and corn imported from the United States. For enforcement, the RD is expressed as glyphosate per se in all crops including transgenic GAT crops and in animal commodities. For dietary risk assessment, the RD is expressed as the sum of glyphosate, *N*-acetylglyphosate, AMPA and *N*-acetyl AMPA, calculated as glyphosate for all plant commodities (including non-GAT crops) as well as for commodities of animal origin. No special consideration has been given to the TMS cation of glyphosate-trimesium with regard to the residue definition or MRLs, but a separate risk assessment has been conducted for glyphosate-TMS. Glyphosate-TMS has a lower ADI compared to the other glyphosate salts.

The residue definitions (see Table VI.3) and tolerance levels or MRLs (see Table VI.2) for a variety of commodities are not harmonized across the different regulatory jurisdictions.

Table VI.2 Canadian Maximum Residue Limits and International Tolerances / Maximum Residue Limits for Glyphosate

Table VI.3 Comparison of Residue Definitions derived by Canada, United States, JMPR/Codex and European Union

Commodity	Canada	United States	JMPR/Codex	European Union
Residue Definition for Enforcement of MRLs/Tolerances				
Transgenic GAT crops	Sum of glyphosate, *N*-acetylglyphosate, AMPA and *N*-acetyl AMPA, expressed as glyphosate[1]	Sum of glyphosate and *N*-acetyl-glyphosate, expressed as glyphosate[1]	Same as United States	Glyphosate
Conventional and transgenic EPSPS/GOX crops	Sum of glyphosate and AMPA, expressed as glyphosate[1]	Glyphosate	Same as United States	
Animal commodities	Sum of glyphosate, *N*-acetylglyphosate and AMPA, expressed as glyphosate[1]	Sum of glyphosate and *N*-acetyl-glyphosate, expressed as glyphosate[1]	Same as United States	
Residue Definition for Risk Assessment				
Transgenic GAT crops	Sum of glyphosate, *N*-acetylglyphosate, AMPA and *N*-acetyl AMPA, expressed as glyphosate[1]	Sum of glyphosate and *N*-acetyl-glyphosate, expressed as glyphosate[1]	Sum of glyphosate, *N*-acetylglyphosate, AMPA and *N*-acetyl AMPA, expressed as glyphosate[1]	Same as JMPR/Codex
Conventional and transgenic EPSPS/GOX crops	Sum of glyphosate and AMPA, expressed as glyphosate[1]	Glyphosate		
Animal commodities	Sum of glyphosate, *N*-acetylglyphosate and AMPA, expressed as glyphosate[1]	Sum of glyphosate and *N*-acetyl-glyphosate, expressed as glyphosate[1]		

[1] Molecular weight conversion factors (MWCF) for field trial residues: glyphosate = 0.8 × *N*-Acetylglyphosate; 1.1 × *N*-Acetyl AMPA; 1.5 × AMPA.

Appendix VII Agricultural Mixer/Loader/Applicator and Postapplication Risk Assessment

Table VII.1 Commercial Mixer/Loader/Applicator Exposure and Risk Assessment

Application Equipment	Scenario	Max. Rate	Area Treated per Day	Dermal Exposure[1] (mg/kg bw/day)	Inhalation Exposure[2] (mg/kg bw/day)	Dermal MOE[3]	Inhalation MOE[3]	Combined MOE[4]
Baseline PPE: Open M/L, Single Layer								
Groundboom (custom)	MLA	4.320 kg/ha	360 ha/day	0.060848	0.046294	490	650	280
Aerial	ML	4.320 kg/ha	536 ha/day	0.059208	0.046310	510	650	280
	A			0.011184	0.002026	2700	15000	2300
Airblast	MLA	4.320 kg/ha	20 ha/day	0.037988	0.007992	790	3800	650
Mechanically pressurized handgun	MLA	0.0096 kg/L	3800 L/day	0.101879	0.068856	290	440	180
Backpack	MLA	0.022 kg/L	150 L/day	0.008822	0.002515	3400	12000	2600
Cut stump application	MLA	0.36 kg/L	150 L/day	0.025471	0.030510	1200	980	540
ROW Sprayer	MLA	0.0096 kg/L	3800 L/day	0.016848	0.003010	1781	9968	1511

M/L = mix/load, A = apply, ATPD = area treated per day, MOE = margin of exposure, ROW = right-of-way

1 Dermal exposure (mg/kg bw/day) = (dermal unit exposure × ATPD × maximum application rate × 4% dermal absorption)/80 kg body weight

2 Inhalation exposure (mg/kg bw/day) = (inhalation unit exposure × ATPD × maximum application rate)/80 kg body weight

3 Based on a NOAEL of 30 mg/kg bw/day, target = 100

4 Combined MOE = 1/[1/dermal MOE + 1/inhalation MOE]

Table VII.2 Mixer/Loader Tree Injection Exposure and Risk Assessment

Application Equipment	Max Rate (g/cm)[1]	Amount Handled per Day (kg a.i.)[2]	Dermal Dose (mg/kg/day)[3]	Inhalation Dose (mg/kg/day)[4]	Dermal MOE[5]	Inhalation MOE[5]	Combined MOE[6]
Baseline PPE: Open M/L, single layer							
Injection	0.0364	0.1456	3.46×10^{-6}	2.91×10^{-6}	8700000	10000000	4700000

MOE = margin of exposure

1 Maximum application rate: 0.182 g/5 cm depth breast height (dbh) = 0.0364 g per cm depth breast height (dbh).

2 Amount handled per day: 0.0364 g/cm × 20 cm (max dbh) × 200 (maximum number of trees treated per day) × 0.001 (g to kg conversion).

3 Dermal Exposure (mg/kg bw/day) = (Amount handled per day (kg) × Dermal Unit Exposure (µg/kg a.i.) × 4% dermal absorption)/80 kg body weight.

4 Inhalation Exposure (mg/kg bw/day) = (Amount handled per day (kg) × Inhalation Unit Exposure (µg/kg a.i.))/80 kg body weight.

5 Based on a NOAEL of 30 mg/kg/day, target MOE = 100.

6 Combined MOE = 1/[1/dermal MOE + 1/inhalation MOE.

Recreational and public areas	See residential assessment						

Crop	Activity	TC[1] (cm^2/hr)	Rate (kg a.i./ha)	Number of Applica-tions per Year	Interval Between Applications (Days)	MOE[2] (Day 0)	REI[3]
USC 4, 27							
Shelterbelts, Nursery stock, Woody ornamentals, short rotation intensive culture	All activities except irrigation	230	4.320	4	7	1700	12 hours
	Irrigation (hand set)	1750				220	
USC 30							
Turf (prior to establishment or renovation)	Scouting	1000	4.320	2	7	18000	12 hours

USC = use site category, REI = restricted entry interval.
Since no DFR or TTR studies were submitted, a peak default DFR value of 25% or a peak default TTR value of 10% of the application rate were used.
[1] TC = transfer coefficient. Values from PMRA memo (PMRA, 2012d).
[2] Based on an oral NOAEL of 30 mg/kg bw/day and a target MOE of 100.
[3] If the target MOE is met, the minimum REI for agricultural uses was set at 12 hours.

Appendix VIII Non-Occupational Risk Assessment

Table VIII.1 Adult Short-Term Residential Applicator Exposure

Application Equipment	Maximum Application Rate[1]	ATPD[2]	Unit Exposure (mg/kg a.i. Handled)		Exposure[3] (mg/kg bw/day)		MOE[4]		Combined MOE[5]
			Dermal	Inhalation	Dermal	Inhalation	Dermal	Inhalation	
Lawns and Turf: Liquid Product (Adult)									
Manually pressurized handwand	28 g a.i./L	18.927 L/day	138.89	0.04	3.68x10^{-2}	2.65x10^{-4}	820	110000	820
Backpack	28 g a.i./L	18.927 L/day	286.60	0.31	7.59x10^{-2}	2.05x10^{-3}	400	15000	400
Sprinkler can	0.700 g a.i./m^2	93 m^2/day	29.54	0.049	9.62x10^{-4}	3.99x10^{-5}	31000	750000	31000
RTU – Trigger-pump sprayer	28 g a.i./L	5 L/day	187.61	0.13	1.31x10^{-2}	2.28x10^{-4}	2300	130000	2300
Gardens and Trees: Liquid Product (Adult)									
Manually-pressurized handwand	28 g a.i./L	18.93 L/day	138.89	0.04	3.68x10^{-2}	2.65x10^{-4}	820	110000	820
Backpack	28 g a.i./L	18.93 L/day	286.60	0.31	7.60x10^{-2}	2.05x10^{-3}	400	15000	400
Sprinkler can	28 g a.i./L	18.93 L/day	127.87	0.0031	3.39x10^{-2}	2.05x10^{-5}	890	1500000	890
RTU – Trigger-pump sprayer	28 g a.i./L	10 L/day	187.61	0.13	2.63x10^{-2}	4.55x10^{-4}	1100	66000	1100

ATPD = area treated per day; MOE = margin of exposure.
Homeowner PPE consists of: short-sleeved shirt, shorts, and no gloves.

[1] Application rate was provided as 0.7 g a.i./m^2. This value was converted to g ai/L using a spray volume of 0.025 L/m^2 (PMRA, 2012).

[2] Default values from USEPA Residential SOP (USEPA, 2012). For lawns and turf RTU-trigger-pump sprayer the default value is 1 container/day and for gardens and trees RTU-trigger-pump sprayer the default value is 2 containers/day. The largest container size of 5 L was used in the risk assessment.

[3] Exposure (mg/kg bw/day) = (Unit exposure (mg/kg a.i.) × ATPD × maximum application rate × 4% dermal absorption factor)/BW (80kg for adults).

[4] Based on a dermal NOAEL of 30 mg/kg bw/day , target MOE is 100.

[5] Calculated using the following equation: Combined MOE = 1/(1/dermal MOE + 1/inhalation MOE).

Table VIII.2 Adult, Youth and Children Short-term Postapplication Exposure and Risk Assessments on Lawns and Turf

Scenario	TC[1] (cm^2/hr)	Duration (Hours)	Dermal Exposure[2] (mg/kg bw /day)	Dermal MOE[3]
1 Application of Glyphosate				
High-Contact Lawn Activities				
Adult	180000	1.5	0.0945	320
Youth	148000	1.3	0.0945	320
Children (1 to < 2)	49000	1.5	0.1871	160
Mowing Turf				
Adult	5500	1.0	0.0019	16000
Youth	4500	1.0	0.0022	14000
2 Applications of Glyphosate (7-day interval)				
High-Contact Lawn Activities				
Adult	180000	1.5	0.1397	220
Youth	148000	1.3	0.1397	220
Children (1 to < 2)	49000	1.5	0.2766	110
Mowing Turf				
Adult	5500	1.0	0.0028	11000
Youth	4500	1.0	0.0033	9200

TC = transfer co-efficient; BW = Body Weight (80 kg for adults, 57 kg for youth, and 11 kg for children [1 to < 2 years old]).

[1] Transfer coefficient are based on the USEPA Residential SOPs (USEPA, 2012). Transfer coefficients based on a body weight of 80 kg were scaled for the surface area of youth and children (1 to < 2 years old) using the correction factors of 0.82 and 0.27 respectively.

[2] Dermal Exposure (mg/kg bw/day) = (TTR (µg/cm^2) × TC (cm^2/hr) × Duration × DA (4%))/BW (kg).

[3] Adult, youth and children short-term MOEs are based on a NOAEL of 30 mg/kg bw/day with a target of 100.

Table VIII.3 Adult, Youth and Children Short-term Postapplication Exposure and Risk Assessments on Golf Course Turf

Scenario	TC[1] (cm^2/hr)	Duration (Hours)	Dermal Exposure[2] (mg/kg bw /day)	Dermal MOE[3]
1 Application of Glyphosate				
Postapplication Exposure to Golf Course Turf				
Adult	5300	4	0.0074	4000
Youth	4400	4	0.0086	3500
Children (6 to < 11)	2900	4	0.0102	3000
2 Applications of Glyphosate (7-day interval)				
Postapplication Exposure to Golf Course Turf				
Adult	5300	4	0.0110	2700
Youth	4400	4	0.0128	2300
Children (6 to < 11)	2900	4	0.0150	2000

TC = transfer co-efficient; BW = Body Weight (80 kg for adults, 57 kg for youth, and 32 kg for children [6 to < 11 years old]).

[1]Transfer coefficient are based on the USEPA Residential SOPs (USEPA, 2012). Transfer coefficients based on a body weight of 80 kg were scaled for the surface area of youth and child (6 to < 11 years old) using the correction factors of 0.82 and 0.55 respectively.

[2] Dermal Exposure (mg/kg bw/day) = (TTR (µg/cm^2) × TC (cm^2/hr) × Duration × DA (4%))/BW (kg).

[3] Adult, youth and children short-term MOEs are based on a NOAEL of 30 mg/kg bw/day with a target of 100.

Table VIII.4 Incidental Oral Exposure Estimates and MOEs for Hand-to-Mouth Transfer to Children

Formulation	Surface	Hand Residue (mg/cm^2)[1]	Oral Dose (mg/kg bw/day)[2]	MOE[3]
1 Application of Glyphosate (7-day TWA)				
Liquid	Lawns/Turf	0.0077	0.0732	410
2 Applications of Glyphosate (7-day interval)				
Liquid	Lawns/Turf	0.0152	0.1451	210

TWA = time weighted average.
[1] Fraction of residue on the hands (mg/cm^2) is the residue available for transfer.
[2] Where Oral Dose (mg/kg bw/day) = [Hand Residue (mg/cm^2) × (Fraction of hand mouthed/event (0.06) × Surface Area of one hand (150 cm^2)) × (Exposure Time (hr) × Replenishment Intervals (4/hr)) × (1 – (1 – Saliva Extraction Factor (0.48)) Number events per hour (13.9)/Replenishment Intervals (4/hr))]/ Body Weight (11 kg).
[3] MOE = margin of exposure; For children (1 to < 2 years old), the short-term MOE was based on a NOAEL of 30 mg/kg bw/day with a target of 100.

Table VIII.5 Incidental Oral Exposure Estimate and MOE for Object-to-Mouth Transfer to Children

Formulation	Surface	Object Residue (mg/cm^2)[1]	Oral Dose (mg/kg bw/day)[2]	MOE[3]
2 Applications of Glyphosate (7-day Interval)				
Liquid	Lawns/Turf	1.034	0.0043	7000

[1] Where Object Residue ($\mu g/cm^2$) was calculated using the TTR equation. 2 applications of glyphosate with a 7 day interval were assumed.
[2] Where Oral Dose (mg/kg bw/day) = [Object Residue ($\mu g/cm^2$) × 0.001 mg/µg × Surface Area Object Mouthed (10 cm^2/event) × (Exposure Time (hr/day) × Replenishment Intervals (4/hr)) × (1 – (1 – Saliva Extraction (0.48)) Number of object-to-mouth events (8.8/hr)/Replenishment Intervals (4/hr))]/ Body weight (11 kg).
[3] MOE = margin of exposure; for children (1 to < 2 years old), short-term MOE was based on a NOAEL of 30 mg/kg bw/day with a target of 100.

Table VIII.6 Bystander Exposure and Risk Assessment

Crop	Activity	TC[1] (cm^2/hr)	Rate (kg a.i./ha)	Dermal Exposure[2] (mg/kg bw/day)	MOE[3] (Day 0)
Forestry[4]	Hiker – Adult	580	4.320	0.0093	3200
	Hiker – Youth	476		0.0107	2800
	Hiker – Child (6 to < 11 years old)	319		0.0127	2400
Non-cropland and Industrial Uses[5]	Hiker – Adult	580	4.320	0.0107	2800
	Hiker – Youth	476		0.0123	2400
	Hiker – Child (6 to < 11 years old)	319		0.0147	2000

[1]TC = transfer coefficient. Value is based on scouting in an orchard. Values from PMRA memo (PMRA, 2012d).
[2] Since no DFR or TTR studies were submitted, a peak default DFR value of 25% of the application rate was used.
[3] Based on an oral NOAEL of 30 mg/kg bw/day and a target MOE of 100.
[4] Based on 2 applications per year with a 7 day interval.
[5] Based on 3 applications per year with a 7 day interval.

Appendix IX Aggregate Risk Assessment

Table IX.1 Aggregate Risk Assessment

Population	M/L/A Scenario	PA Scenario[1]	Total Dermal + Inhalation Exposure (mg/kg bw/day)[2]	Incidental Oral Exposure (mg/kg bw/day)	Chronic Dietary Exposure (mg/kg bw/day)[3]	Total Exposure (mg/kg bw/day)[4]	Aggregate MOE[5]

Population	M/L/A Scenario	PA Scenario[1]	Total Dermal + Inhalation Exposure (mg/kg bw/day)[2]	Incidental Oral Exposure (mg/kg bw/day)	Chronic Dietary Exposure (mg/kg bw/day)[3]	Total Exposure (mg/kg bw/day)[4]	Aggregate MOE[5]
Children (1 to < 2)	—	High Contact Lawn Activities	0.1394[6]	0.0732[6]	0.1125	0.3251	98

M/L/A = Mixer, Loader, Applicator; PA = postapplication.
[1] Based on 1 application of glyphosate.
[2] Total Dermal + Inhalation Exposure (mg/kg bw/day) = Sum of Dermal and Inhalation Exposures from Handler and Postapplication Scenarios (See Tables III.1 to III.4).
[3] See Section 3.5.2.
[4] Total Exposure (mg/kg bw/day) = (Total Dermal + Inhalation Exposure) + Incidental Oral Exposure + Chronic Dietary Exposure.
[5] Based on an oral NOAEL of 32 mg/kg bw/day and a target MOE of 100.
[6] 1 application of glyphosate along with a 7-day time-weighted DFR average was used (the average residues of glyphosate were calculated over a 7-day span) for this lifestage (see Table III.5).

Appendix X Environmental Fate, Toxicity and Risk Assessment of Glyphosate

Table X.1 Fate and Behaviour of Glyphosate, Its Transformation Product AMPA and the Formulant POEA in the Terrestrial Environment

Property	Test Substance	Material	DT_{50} (Days)	DT_{90} (Days)	Rep $t_{1/2}$ (days)	Kinetic Models	Major Transf. Prod.	Comments [1]
Phototransformation in soil	Glyphosate	Sandy loam, pH7.6, O.M. 1.6%. 22.2ºC Ray siltt loam, pH 8.2, O.M. 1.2% Les Evouettes silt loam, pH 6.1, O.M. 2.4% Visalia sandy loam, pH 8.3, O.M. 0.6%	90.2 (96.3 dark) 45.0 402.0 6.5 (6.6 dark)	NR NR NR NR	NR NR NR NR	SFO SFO SFO? SFO	None None None AMPA	Not a major route of transformation in the environment
	AMPA	California sandy loam	AMPA was detected at 19.9% AR and 24% AR in irradiated and dark samples at study termination from exposition of glyphosate to sunlight. The presence of AMPA was linked to microbial activity rather than photolytic process. Phototransformation is unlikely to be major route of dissipation					
Phtotransformation in air	Glyphosate	NR	Glyphosate is considered to be non-volatile, having a very low vapour pressure and low Henry's law constant. Photransformation is not expected to be a major route of transformation					
	AMPA	NR	Glyphosate is unlikely to be volatile since it is formed in soil and bind strongly to soil particles. Photransformation is not expected to be a major route of transformation

Bioaccumulation	Glyphosate	Log K_{ow} -2.8 to -0.67	Not expected to bioaccumulate					

Property	Test Substance	Material	DT_{50} (Days)	DT_{90} (Days)	Rep $t_{1/2}$ (Days)	Kinetic Models	Transf. Prod.	Comments [1]
		BAF:0.03-42.3						
	AMPA	Log K_{ow}: -2.36to -1.61	Not expected to bioaccumulate					
	POEA	Log K_{ow} : 2.2-5.89 BAF of 150 mL/kg	Due to their nature, POEA compounds (a complex mixture of as many as 100 discrete tertiary amine molecules) may have the potential for bioaccumulation. Log K_{ow} and BAF were obtained from the BCF/BAF v 3.0 model of EPIWIN v. 4 .0. However, given that the components of these compounds are easily broken down and that it is not persistent in soil and water, significant bioaccumulation under field conditions is unlikely. POEA does not meet Track-1 criteria.

Earthworm *Eisenia andrei*	Montana® (30.8)	56-d LC_{50}	Not determined	Significant increase of juveniles in 50% dilution test (around 0.41 mg a.e./kg soil).	NA
	Roundup® FG	56-d $LC5_0$	> 1.440 kg EUP/ha > 1.066 kg a.e./ha > 0.47 mg a.e./kg soil[2]	Effect on hatchability: 41% of control at tested rate of application. NOEC not reported.	NA

Species Name or Taxon	Formulation Type	Reported Endpoint	Value	Comment	Degree of Toxicity
Earthworm *Eisenia foetida*	MON 0139 (Glyphosate IPA salt)	56-d NOEC	28.79 mg EUP/kg soil **21.3 mg a.e./kg soil** or 30240 g a.e./ha	No effect on reproduction at highest test concentration.	NA
Transformation product AMPA					
Earthworm *Eisenia foetida*	AMPA (99.1%)	56-d NOEC	**28.12 mg/kg soil**	No effect on reproduction at high test concentration.	NA

1 = The 48-hr filter paper test toxicity is based on the classification of Roberts and Durough (1983).

2 = Calculated by the PMRA, where endpoint value = 1 067 000 mg a.e/ ha / (0.15 m [soil depth] × 100 m × 100 m × 1500 kg/ m3 [soil bulk density]).

ND = Not detected.

NR = Not reported.

NA = Not available.

End-points in bold are to be used in risk assessment.

Table X.9 Toxicity Values of Glyphosate Technical and its Formulations to Honeybees

Formulation Type	Reported Endpoint	Toxicity Value	Degree of Toxicity[1]
Acute Oral			
Glyphosate Technical			
Glyphosate Technical (98.5%)	48-hr LD_{50}	> 100 µg/bee	Relatively non-toxic
Glyphosate Technical (98.5%)	LD_{50} NOEL	> 182 µg ae/bee 182 µg ae/bee (highest concentration tested)	Relatively non-toxic
CP67573 Technical	LD_{50}	> 100 µg ae/bee	Relatively non-toxic
Glyphosate Formulation (With POEA)			
Glyphosate IPA salt, MON 2139 (36%)	LD_{50}	> 100 µg/bee	Relatively non-toxic
MON 77360 (30% w/w glyphosate a.e.)	LD_{50} NOEL	> 30 µg ae/bee (> 100 µg EUP/bee) 15 µg ae/bee	Relatively non-toxic
MON 78568 monoammonium salt (65.6% a.e)	LD_{50} NOEL	> 100 µg /bee 100 µg ae/bee	Relatively non-toxic
MON 2139 (36% a.e.)	LD_{50}	> 100 µg a.e./bee	Relatively non-toxic

Formulation Type	Reported Endpoint	Toxicity Value	Degree of Toxicity[1]
Glyphosate Formulation (POEA Unknown)			
Glyphosate 360 g/L	LD_{50} NOEL	> 86.3 µg ae/bee (> 317 µg EUP/bee) 86.3 µg ae/bee (317 µg EUP/bee) (high concentration tested)	Relatively non-toxic
Acute Contact			
Glyphosate Technical			
Glyphosate Technical (97.6%)	48-hr LD_{50}	> 100 µg/bee	Relatively non-toxic
Glyphosate Technical (98.5%)	LD_{50} NOEL	> 182 µg ae/bee 182 µg ae/bee (highest concentration tested)	Relatively non-toxic
CP67573 Technical	LD_{50}	> 100 µg ae/bee	Relatively non-toxic
Glyphosate Formulation (With POEA)			
Glyphosate IPA salt, MON 2139 (36%)	LD_{50}	> 100 µg/bee	Relatively non-toxic
MON 77360 (30% w/w glyĥosate a.e.)	LD_{50} NOEL	> 30 µg ae/bee (> 100 µg EUP/bee) 30 µg ae/bee (highest concentration tested)	Relatively non-toxic
MON 78568 monoammonium salt (65.6% a.e)	LD_{50} NOEL	> 76.23 µg /bee 76.23 µg ae/bee (highest concentration tested)	Relatively non-toxic
MON 6500 (31.32% a.e.)	48-hr LD_{50} NOAEL	> 31.3 µg ae/bee 31.3 µg ae/bee[2] (highest concentration tested)	Relatively non-toxic
MON 2139 (36% a.e.)	LD_{50}	> 100 µg a.e./bee	Relatively non-toxic
Glyphosate Formulation (POEA Unknown)			
Glyphosate 360 g/L	LD_{50} NOEL	> 116 µg ae/bee (> 426 µg EUP/bee) 116.3 µg ae/bee (426 µg EUP/bee) (highest concentration tested)	Relatively non-toxic

[1] = Acute and oral toxicity classifcation based on Atkins et al. 1981.

[2] This value was reported as 319 µg ae/bee, which has been deemed to be a typo. No effects were observed up to 100 µg EUP/bee, corresponding to 31.3 µg ae/bee based on the purity of 31.32%.

Table X.10 Toxicity Values of Glyphosate Technical and its Formulations to Beneficial Insects

Species Name or Taxon	Formulation Type	Exposure	Reported Endpoint	Toxicity Value	Measurement Endpoint
Glyphosate Technical					
Western bigeyed bug, *Geocoris pallens*	Glyphosate NOS	Leaf substrate at rates up to 6.7 kg/ha	LD_{50}	280 g a.e./ha (Duration and routes of exposure are unclear)[1]; dose-response *increases* in survival and also in egg viability compared to controls	Mortality, fecundity
Glyphosate Formulation (WITH POEA)					
Predatory mite, *Typhlodromus pyri*	MON 78568, monomammonium salt	Glass plates	7-d LR_{50}	1200 g a.e./ha; NOAER: 216 g a.e/ha	Mortality, fecundity
		Leaf substrate	7-d LR_{50} NOAER	> 4320 g a.e./ha; 216 g a.e/ha	Mortality, fecundity
Parasitic wasp, *Aphidius rhopalosiphi*	MON 78568, monomammonium salt	Glass plates	48-hr LR_{50} 13-d LR_{50} NOAER:	> 108 g a.e./ha > 4320 g a.e./ha 4320 g a.e/ha	Mortality, fecundity
		Leaf substrate	48-hr LR_{50} 13-d LR_{50} NOAER:	> 4320 g a.e./ha > 4320 g a.e./ha; 4320 g a.e/ha	Mortality, fecundity
Lacewing, *Chrysoperla carnea*	MON 78568, monomammonium salt	Glass plates	10-d LR_{50}	> 4320g a.e./ha; NOAER: 4320 g a.e/ha	Mortality, fecundity
Predatory mite, *Euseius victoriensis*	Roundup (360 g/L)	Leaf substrate	48-h and 7-d	At 787 g a.i./ha, 2-3% mortality between 48-h and 7-d; fecundity reduced by 15.5%	Mortality and fecundity
Glyphosate formulation (POEA UNKNOWN)					
Predatory mite, *Typhlodromus pyri*	Glyphosate 360 g/L, SL di-ammonium salt	Glass plates	7-d LR_{50} NOER	161.9 g a.e/ha 120 g a.e./ha (fecundity)	Mortality, fecundity
		Leaf substrate	7-d LR_{50} NOER	1567 g a.e/ha; 720 g a.e./ha	Mortality, fecundity
Parasitic wasp, *Aphidius rhopalosiphi*	Glyphosate 360 g/L, SL di-ammonium salt	Glass plates	48-hr LR_{50} NOER	2267 g a.e./ha < 598 g a.e./ha	Mortality, fecundity
		Leaf substrate	48-hr LR_{50} NOER	>5976 g a.e./ha 5976 g a.e./ha	Mortality, fecundity
Hoverfly, *Episyrphus balteatus*	Glyphosate 360 g/L, SL di-ammonium salt	Leaf substrate	48-hr LR_{50} NOER	> 5976 g a.e./ha 5976 g a.e./ha	Mortality, fecundity

Species Name or Taxon	Formulation Type	Exposure	Reported Endpoint	Toxicity Value	Measurement Endpoint
Lacewing, *Chrysoperla carnea*	Glyphosate 360 g/L, di-ammonium salt	Glass plates	48-hr LR_{50} NOER	> 5976 g a.e./ha 5976 g a.e./ha	Mortality, fecundity
Carabid beetle, *Poecilus cupreus*	Glyphosate 360 g/L, di-ammonium salt	Soil substrate	7-d LR_{50} NOER =	> 2988 g a.e./ha 2988 g a.e./ha	Mortality, prey consumption
Staphylinid beetle, *Aleochara bilineata*,	Glyphosate 360 g/L, di-ammonium salt	Soil substrate	28-d NOER	5976 g a.e./ha (highest rate tested)	Reproduction

[1]The duration of exposure is not clear and the nature of the exposure appears to be a combination of contact and oral. The results of this study are not particularly useful.

Table X.11 Toxicity Values of Glyphosate Technical and its Formulations to Birds

Species Name or Taxon	Formulation Type	Reported Endpoint	Toxicity Value	Degree of Toxicity[1]
Acute Oral				
Glyphosate Technical				
Bobwhite quail, *Colinus virginianus*	Glyphosate acid (95.6%)	LD_{50} NOEL	> 1912 mg a.e./kg bw 1912 mg a.e./kg bw (highest concentration tested)	Practically non-toxic
Bobwhite quail, *Colinus virginianus*	Glyphosate technical (97.5%)	LD_{50}	> 2000 mg/kg bw	Practically non-toxic
Bobwhite quail, *Colinus virginianus*	Glyphosate technical	LD_{50}	> 3196.3 mg a.e/kg bw	Practically non-toxic
Mallard duck, *Anas platyrhynchos*	Glyphosate technical (97.5%)	LD_{50} NOEL	> 2000 mg ae/kg bw 2000 mg a.e./kg bw (highest concentration tested)	Practically non-toxic
Canary, *Serinus canaria*	Glyphosate (acid, 96.3%)	LD_{50} NOAEL ED_{50}	> 2000 mg a.e./kg bw 1200 mg a.e./kg bw 2819 mg ae/kg bw (regurgitation)	Practically non-toxic

Species Name or Taxon	Formulation Type	Reported Endpoint	Toxicity Value	Degree of Toxicity[1]
Glyphosate Formulation (POEA Unknown)				
Bobwhite quail, *Colinus virginianus*	**MON 58121 – no information on the glyphosate content in the formulation**	**LD_{50} NOEL NOEL**	**598 mg MON 58121/kg bw[3] 292 mg MON 58121/kg bw (mortality) < 175 mg MON 58121/kg bw (body weight and food consumption)**	**Formulation is slightly toxic.**
Bobwhite quail, *Colinus virginianus*	Glyphosate monoammonium salt, 68.5% a.i. (MON 14420 formulation)	LD_{50} NOAEL	1131 mg a.e./kg bw (1651mg formulation/kg bw) 333 mg a.e./kg bw (effect not reported)	Formulation is slightly toxic.
AMPA				
Bobwhite quail, *Colinus virginianus*	AMPA, 87.8%	LD_{50} NOAEL	> 1976 mg/kg bw NOAEL: 1185 mg/kg bw	AMPA is not toxic up to the highest concentraton tested.
Acute Dietary				
Glyphosate Technical				
Bobwhite quail, *Colinus virginianus*	Glyphosate acid (95.6%)	5-d LC_{50} NOEC =	>1743 mg a.e./kg bw/day 4860 mg a.e./kg diet (highest concentration tested)	Practically non-toxic
Bobwhite quail, *Colinus virginianus*	Glyphosate acid (95.6%)	LC_{50} NOAEC	>5200 mg/kg diet (nominal) (>4971.2 mg a.e./kg diet corrected for purity); equivalent to 5-d LD_{50} >528 mg a.e./kg bw/day[2] 4971.2 mg a.e./kg diet	Practically non-toxic
Bobwhite quail, *Colinus virginianus*	Glyphosate (98.5%)	LC_{50} NOAEC	>4640 mg a.e./kg diet (>4570 mg a.e./kg diet corrected for purity); equivalent to 5-d LD_{50} >485 mg a.e./kg bw/day[2] 4570 mg a.e./kg diet (highest concentration tested)	Not toxic up to highest concentration tested

Species Name or Taxon	Formulation Type	Reported Endpoint	Toxicity Value	Degree of Toxicity[1]
Mallard duck, *Anas platyrhynchos*	Glyphosate acid (95.6%)	5-d LC_{50} NOEC	>5160 mg ae/kg diet based on measured concentrations (>4971 mg ae/kg diet based on nominal concentrations corrected for purity); equivalent to a 5-d LD_{50} >2580 mg ae/kg bw/day 5160 mg a.e./kg diet based on mean measured concentrations (highest concentration tested)	Practically non-toxic
Glyphosate Formulation (POEA Unknown)				
Bobwhite quail, *Colinus virginianus*	MON 58121 – no information glyphosate content in the formulation	LC_{50} NOEC =	>5620 mg MON 58121/kg diet[3]; equivalent to >597 mg MON 58121/kg bw/day 3160 mg MON 58121/kg diet (body-weight gain)	Formulation is practically non-toxic
Bobwhite quail, *Colinus virginianus*	Glyphosate isopropylamine salt, 31.32% a.i. (MON65005)	LC_{50} NOAEC	>1760 mg a.e./kg bw; equivalent to LD_{50} >187 mg a.e./kg bw/day[2] 1760 mg a.e./kg bw (highest concentration tested)	Formulation is not toxic up to the highest concentration tested
Mallard duck, *Anas platyrhynchos*	Glyphosate isopropylamine salt, 31.32% a.i. (MON65005)	LC_{50} NOAEC	>1760 mg a.e./kg bw; equivalent to LD_{50} >100 mg a.e./kg bw/day[2] 1760 mg a.e./kg bw (highest concentration tested)	Formulation is not toxic up to the highest concentration tested
Glyphosate Formulation (With POEA) 21-day Dietary				
Chicken	Roundup	21-d NOEC	45% reduced body weight at 4500 mg a.e./kg diet compared to controls after 21-days of expsoure. = 450 mg a.e./kg diet (body weight), reported to be equivalent to a 21-day dietary NOEL of approximately 43 mg a.e./kg bw/day based on a 9.5% consumption rate of body weight.	NR

Species Name or Taxon	Formulation Type	Reported Endpoint	Toxicity Value	Degree of Toxicity[1]
AMPA				
Bobwhite quail, *Colinus virginianus*	AMPA, 87.8%	LC_{50} NOAEC	>4934 mg/kg bw 4934 mg/kg bw	AMPA is not toxic up to the highest concentration tested
Mallard duck, *Anas platyrhynchos*	AMPA, 87.8%			
Reproduction				
Glyphosate Technical				
Bobwhite quail, *Colinus virginianus*	Glyphosate technical (83%)	NOEC	1000 mg a.e./kg diet (highest concentration tested) (830 mg a.e./kg diet corrected for purity); equivalent to NOEL= 88 mg a.e./kg bw/day[2]	—
Bobwhite quail, *Colinus virginianus*	Glyphosate acid (95.6%)	NOEC	2160 mg ae/kg diet (highest concentration tested); equivalent to NOEL = 198 mg ae/kg bw/day	—
Mallard duck, *Anas platyrhynchos*	Glyphosate (acid, 95.6%)	NOEC	2160 mg a.e./kg diet (highest concentration tested); equivalent to NOEL of 291 mg a.e./kg bw/day	—
Mallard duck, *Anas platyrhynchos*	Glyphosate (acid, 90.4%)	NOEC	30 mg a.e./kg diet (27 mg ae/kg diet corrected for purity) (highest concentration tested) equivalent to NOEL of 1.5 mg a.e./kg bw/day[2]	—
Mallard duck, *Anas platyrhynchos*	Glyphosate technical (83%)	NOAEC	1000 mg a.e./kg diet (830 mg ae/kg diet corrected for purity) (highest concentration tested) equivalent to NOAEL = 47 mg a.e./kg bw/day[2]	—

[1] Oral and DietaryToxicity classification of bird; Hazard Evaluation Division, Standard Evaluation Procedure, USEPA, 1985.
[2] The toxicity endpoint was converted by the reviewer from a concentration to a daily dose using the following general equation: Daily Dose = Concentration in food × (FIR/BW). In the absence of data from the study, default adult body weights (178 g for bobwhite quail and 1082 g for mallard duck) and food ingestion rates (18.9 g dry weight food/day for bobwhite quail and 61.2 g dry weight food/day for mallard duck) were used in the calculation.
[3]Content of glyphosate in the formulation is not reported. This endpoint cannot be used for risk assessment purposes, as the daily doses used in calculations are on an active ingredient (or, in this case, acid equivalent) basis. It is also noted that the relevance of formulation MON 58121 to Canada is not known.

Table X.12 Toxicity Values of Glyphosate Technical and its Formulations to Mammals

Species Name or Taxon	Formulation Type	Reported Endpoint	Toxicity Value	Degree of Toxicity[1]
Acute Oral				
Glyphosate Technical				
Rat	Glyphosate technical (99%)	LD_{50}	5600 mg/kg bw	Practically non-toxic
	Glyphosate technical (97.3%)	LD_{50}	> 5000 mg/kg bw	Practically non-toxic
	Glyphosate technical (95.6%)	LD_{50}	> 5000 mg/kg bw	Practically non-toxic
	Glyphosate technical (97.4%)	LD_{50}	> 5000 mg/kg bw	Practically non-toxic
	Glyphosate acid (76 to 97.2%)	LD_{50}	> 1920 to > 4860 mg a.e./kg bw (8 studies)	Practically non-toxic
	Glyphostate isopropylamine salt	72 hr LD_{50}	approximately equal to 4400 mg a.e./kg bw (based on 5957 mg a.i./kg bw)	Practically non-toxic
	Glyphostate isopropylamine salt	LD_{50}	> 5000 mg/kg bw (equivalent to >3700 mg a.e./kg bw)	Practically non-toxic
	Glyphosate technical	LD_{50}	4873 mg/kg bw	Practically non-toxic
	Glyphosate technical	LD_{50}	> 5000 mg/kg bw (same value for three different studies)	Practically non-toxic
Mouse	Glyphosate technical	LD_{50}	1568 mg/kg bw	Slightly toxic
Deer mouse	Glyphostate isopropylamine salt	LD_{50}	> 6000 mg/kg bw (equivalent to >4440 mg a.e./kg bw)	Practically non-toxic
Glyphosate Formulation (POEA Unknown)				
Rat	H-M2028, 11.4% a.i.	LD_{50}	357 mg a.e./kg bw (estimated to be equivalent to 3132 mg formulation/kg bw)	Formulation is practically non-toxic.
	MON 20033 (EZ-Ject Capsuls), 63% a.i.	LD_{50}	3150 mg a.e./kg bw (5000 mg formulation/kg bw)	Formulation is practically non-toxic.
	MON 77063 (Roundup Ultradry), 65.4% a.i.	LD_{50}	2599 mg a.e./kg bw (5827 mg formulation/kg bw)	Formulation is practically non-toxic.
	Glyphomax, isopropylamine	LD_{50}	724 mg a.e./kg bw (3803 mg formulation/kg bw)	Formulation is practically

Species Name or Taxon	Formulation Type	Reported Endpoint	Toxicity Value	Degree of Toxicity[1]
	salt, 22.9% a.i.			non-toxic.
	MON 20047, 18.4% a.i. (Roundup Rainfast, 25.1% isopropylamine salt, 18.6% a.e.)	LD_{50}	460-690 mg a.e./kg bw (3750 mg formulation/kg bw)	Formulation is practically non-toxic.
	Various glyphosate formulations	LD_{50}	>35.5 to >4000 mg a.e./kg bw (41 studies)	Formulation is not toxic up to the highest concentra-tion tested.
Glyphosate Formuation (With POEA)				
Rat	Roundup (360 g/L, 18% surfactant)	LD_{50}	2300 mg formulation/kg bw	Formulation is practically non-toxic.
Rat	Roundup (41% a.e., 15% surfactant)	72-hr LD_{50}	1619 mg a.e./kg bw (5337 mg formulation/kg bw)	Formulation is practically non-toxic.
Rat	Roundup	LD_{50}	>5000 mg/kg bw (unit for exposure not specified)	Formulation is practically non-toxic.
Mouse	Roundup	LD_{50}	2300 mg formulation/kg bw (unit for exposure not specified)	Formulation is practically non-toxic.
Two-generation Reproduction (Dietary Exposure)				
Gyphosate Technical				
Rat	Glyphosate technical (97.7%)	Parental: NOAEL Offspring: NOAEL Repro: NOAEL	685/779 mg/kg bw/day (males/females) (decreased body weight and body-weight gain) 115/160 mg/kg bw/day (males/females) (decreased body weight) 1768/2322 mg/kg bw/day (males/females) (highest concentration tested)	—
	Glyphosate technical (99.2%)	Parental: NOAEL Offspring:	143/179 mg/kg bw/day (males/females) (decreased body weight and body-weight gain)	—

Species Name or Taxon	Formulation Type	Reported Endpoint	Toxicity Value	Degree of Toxicity[1]
		NOAEL Repro: NOAEL	488/595 mg/kg bw/day (males/females) (highest concentration tested) 488/595 mg/kg bw/day (males/females) (highest concentration tested)	
	Glyphosate technical (98%)	Parental: NOAEL Offspring: NOAEL Repro: NOAEL	985/1054 mg/kg bw/day (males/females) (highest concentration tested) 99.4/104 mg/kg bw/day (males/females) (decreased body weight) 985/1054 mg/kg bw/day (males/females) (highest concentration tested)	—
	Glyphosate technical (97.67%)	NOAEL LOAEL	500 mg/kg bw/day (decreased body-weight gain in F1a, F2a and F2b male and female pups during lactation) 1500 mg/kg bw	—
Multi-generation (Dietary Exposure)				
Glyphosate Technical				
Rat	Glyphosate acid (98.7%)	NOAEL LOAEL	740 mg/kg bw/day (decreased body weight in parents and pups and equivocal decrease in average litter size) 2268 mg/kg bw/day	—
Three-generation (Dietary Exposure)				
Glyphosate Technical				
Rat	Glyphosate acid	NOAEL	30 mg/kg bw/day (highest concentration tested)	—

[1] According to USEPA Hazard Classification Scheme (1985).

Table X.13 Toxicity Values of Glyphosate Technical and its Formulations to Terrestrial Plant – Seedling Emergence

Species Name or Taxon	Formulation Type	Study Duration	Reported Endpoint	Toxicity Value (kg a.e./ha)	Measurement Endpoint
Glyphosate Technical					
Tomato, *Solanum lycopersicum*	Technical	21-d	EC_{25} - EC_{50}	1.57-3.25	Dry weight
Corn, Zea mays	Technical	21-d	EC_{25} - EC_{50}	> 4.48- > 4.48	Survival, plant height, dry weight
Oat, *Avena sativa*	Technical	21-d	EC_{25} - EC_{50}	> 4.48- > 4.48	Survival, plant height, dry weight
Oat, *Avena sativa*	CP-70139 IPA 50%	14-d	EC_{25} - EC_{50}	> 11.21- >11.21	Emergence
Onion, *Allium cepa*	Technical	21-d	EC_{25} - EC_{50}	2.02-4.26	Plant height

Sicklepod, *Senna obtusifolia*	Glyphosate acid, wettable powder, 48.3%	28-d	EC_{25} - EC_{50}	> 4.48- >4.48	Emergence, dry weight

Table X.14 Toxicity Values of Glyphosate Technical and its Formulations to Terrestrial Plant – Vegetative Vigour

Species Name or Taxon (Latin)	Formulation Type	Study Duration (Day)	Endpoint Type	Toxicity Value (kg a.e./ha)	Measurement Endpoint
Glyphosate Technical					
Onion, *Allium cepa*	Glyphosate acid (96.6% purity)	21	EC_{25}	0.95	Dry weight
Onion, *Allium cepa*	Glyphosate IPA	21	EC_{25}	0.72	Dry weight
Oat, *Avena sativa*	Glyphosate acid (96.6% purity)	21	EC_{25}	0.43	Dry weight
Oat, *Avena sativa*	Glyphosate IPA	21	EC_{25}	0.74	Dry weight, survival
Cabbage, *Brassica oleraceae* var. capitata	Glyphosate acid (96.6% purity)	21	EC_{25}	0.34	Dry weight

Species Name or Taxon (Latin)	Formulation Type	Study Duration (Day)	Endpoint Type	Toxicity Value (kg a.e./ha)	Measurement Endpoint
Cucumber, *Cucumis sativus*	Glyphosate acid (96.6% purity)	21	EC_{25}	0.46	Dry weight
Cucumber, *Cucumis sativus*	Glyphosate IPA	21	EC_{25}	0.51	Plant height
Carrot, *Daucus carota*	Glyphosate IPA	21	EC_{25}	0.33	Dry weight
Soybean, *Glycine max*	Glyphosate acid (96.6% purity)	21	EC_{25}	0.47	Dry weight
Soybean, *Glycine max*	Glyphosate IPA	21	EC_{25}	0.33	Dry weight
Sunflower, *Helianthus annuus*	Glyphosate IPA	21	EC_{25}	0.15	Dry weight
Lettuce, *Lactuca sativa*	Glyphosate acid (96.6% purity)	21	EC_{25}	0.45	Dry weight
Perennial rygrass, *Lolium perenne*	Glyphosate acid (96.6% purity)	21	EC_{25}	0.90	Dry weight
Radish, *Raphanus sativus*	Glyphosate acid (96.6% purity)	21	EC_{25}	0.16	Dry weight
Radish, *Raphanus sativus*	Glyphosate IPA	21	EC_{25}	0.09	Dry weight
Tomato, *Solanum lycopersicum*	Glyphosate acid (96.6% purity)	21	EC_{25}	0.10	Dry weight
Tomato, *Solanum lycopersicum*	Glyphosate IPA	21	EC_{25}	0.24	Dry weight
Wheat, *Triticum aestivum* (winter)	Glyphosate IPA	21	EC_{25}	0.20	Dry weight
Corn, *Zea mays*	Glyphosate acid (96.6% purity)	21	EC_{25}	0.41	Dry weight
Corn, *Zea mays*	Glyphosate IPA	21	EC_{25}	0.30	Dry weight
Onion, *Allium cepa*	Glyphosate acid (96.6% purity)	21	EC_{50}	1.79	Dry weight
Onion, *Allium cepa*	Glyphosate IPA	21	EC_{50}	0.74	Dry weight

Species Name or Taxon (Latin)	Formulation Type	Study Duration (Day)	Endpoint Type	Toxicity Value (kg a.e./ha)	Measurement Endpoint
Oat, *Avena sativa*	Glyphosate acid (96.6% purity)	21	EC_{50}	0.87	Dry weight
Oat, *Avena sativa*	Glyphosate IPA	21	EC_{50}	0.74	Dry weight, survival
Cabbage, *Brassica oleraceae* var. capitata	Glyphosate acid (96.6% purity)	21	EC_{50}	0.74	Dry weight
Cucumber, *Cucumis sativus*	Glyphosate acid (96.6% purity)	21	EC_{50}	0.90	Dry weight
Cucumber, *Cucumis sativus*	Glyphosate IPA	21	EC_{50}	0.74	Dry weight, height
Carrot, *Daucus carota*	Glyphosate IPA	21	EC_{50}	0.65	Dry weight
Soybean, *Glycine max*	Glyphosate acid (96.6% purity)	21	EC_{50}	0.97	Dry weight
Soybean, *Glycine max*	Glyphosate IPA	21	EC_{50}	0.66	Dry weight
Sunflower, *Helianthus annuus*	Glyphosate IPA	21	EC_{50}	0.30	Dry weight
Lettuce, *Lactuca sativa*	Glyphosate acid (96.6% purity)	21	EC_{50}	0.76	Dry weight
Perennial rygrass, *Lolium perenne*	Glyphosate acid (96.6% purity)	21	EC_{50}	1.34	Dry weight
Radish, *Raphanus sativus*	Glyphosate acid (96.6% purity)	21	EC_{50}	0.25	Dry weight
Radish, *Raphanus sativus*	Glyphosate IPA	21	EC_{50}	0.25	Survival
Tomato, *Solanum lycopersicum*	Glyphosate acid (96.6% purity)	21	EC_{50}	0.15	Dry weight
Tomato, *Solanum lycopersicum*	Glyphosate IPA	21	EC_{50}	0.53	Dry weight
Wheat, *Triticum aestivum* (winter)	Glyphosate IPA	21	EC_{50}	0.65	Dry weight
Corn, *Zea mays*	Glyphosate acid (96.6% purity)	21	EC_{50}	0.75	Dry weight

Species Name or Taxon (Latin)	Formulation Type	Study Duration (Day)	Endpoint Type	Toxicity Value (kg a.e./ha)	Measurement Endpoint

[1]EDE = Estimated dietary exposure; is calculated using the following formula: (FIR/BW) × EEC, where: FIR: Food Ingestion Rate (Nagy, 1987). For mammals, the "all mammals" equation was used: FIR (g dry weight/day) = 0.235(BW in g) $^{0.822}$.
BW: Generic Body Weight ; EEC: Concentration of pesticide on food item based on Hoerger and Kenaga (1972) and Kenaga (1973) and modified according to Fletcher et al. (1994). At the screening level, relevant food items representing the most conservative EEC are used.
Shaded cells and **bold values** indicate that the level of concern is exceeded (RQ > 1).

Table X.26 Risk Assessment (In-field and Off-field) and Risk Quotients for Terrestrial Vascular Plants (Seedling Emergence and Vegetative Vigour) at the Maximum Rate of Application for Glyphosate in Different Crop Productions

Organism	Exposure	Endpoint Value	Crop	EEC	RQ[1]

Appendix XI Glyphosate Aquatic Ecoscenario and Drinking Water Assessment

Modelling Results

Aquatic Ecoscenario Assessment: Level 1 Modelling

For Level 1 aquatic ecoscenario assessment, estimated environmental concentrations (EECs) of glyphosate from runoff into a receiving water body were simulated using the PRZM/EXAMS models. The PRZM/EXAMS models simulate pesticide runoff from a treated field into an adjacent water body and the fate of a pesticide within that water body. For the Level 1 assessment, the water body consists of a 1 ha wetland with an average depth of 0.8 m and a drainage area of 10 ha. A seasonal water body was also used to assess the risk to amphibians, as a risk was identified at the screening level. This water body is essentially a scaled-down version of the permanent water body noted above, but having a water depth of 0.15 m. EECs for glyphosate in pore water were also generated in a water body with an average depth of 0.8 m.

A number of initial application dates between April and November were modelled. Table 2 lists the application information and the main environmental fate characteristics used in the simulations. The EECs are for the portion of the pesticide that enters the water body via runoff only; deposition from spray drift is not included. The models were run for 50 years for all scenarios. The major groundwater and surface water model inputs for level 1 assessment used the combined residues of glyphosate and its transformation product AMPA as the most conservative values in potential sources of drinking water. The major input parameters for the model are summarized in TableXI.1.

The EECs are calculated from the model output from each run as follows. For each year of the simulation, PRZM/EXAMS calculates peak (or daily maximum) and time-averaged concentrations. The time-averaged concentrations are calculated by averaging the daily concentrations over five time periods (96-hour, 21-day, 60-day, 90-day, and 1 year). The 90^{th} percentiles over each averaging period are reported as the EECs for that period.

The largest EECs of all selected runs of a given use pattern/regional scenario are reported in Tables XI.3-5, Appendix XI.

Table XI.1 Major Groundwater and Surface Water Model Inputs for Level 1 Assessment of Glyphosate and AMPA (Combined Residues)

Type of Input	Parameter	Value
Application Information	Crop(s) to be treated	Apple, potato, wheat, canola, corn, soybean, turf and sod, and other crops
	Maximum allowable application rate per year (g a.i./ha)	12600 for apple 10445 for corn 9542 for canola, wheat and soybean 4320 for potato and other crops
	Maximum rate each application (g a.i./ha)	4320 for all crops
	Maximum number of applications per year	3 for apple, canola, wheat and soybean 4 for corn 1 for potato and other crops
	Minimum interval between applications (days)	14 for apple and corn 10 for canola, wheat and soybean
	Method of application	Aerial and ground for drinking water modelling ground for ecological modelling
Environmental Fate Characteristics	Hydrolysis half-life at pH 7 (days)	Stable for the combined residue 1627 for parent glyphosate
	Photolysis half-life in water (days)	216
	Adsorption K_{OC} (mL/g)	30 (20th percentile of 11 K_d values for "AMPA") for drinking water modelling 48.8 (20th percentile of 10 K_d values for "glyphosate") for ecological modelling
	Aerobic soil biotransformation half-life (days)	135.3 (90th percentile confidence bound on mean of 4 half-life values adjusted to 25ºC for the combined residue for drinking water modelling) 32.6 (90th percentile confidence bound on mean of 7 half-life values adjusted to 25ºC for glyphosate for ecological modelling)
	Aerobic aquatic biotransformation half-life (days)	637 (80th percentile of 3 half-life values for the combined residue for drinking water modelling) 413.6 (80th percentile of 3 half-life values for glyphosate for ecological modelling)
	Anaerobic aquatic biotransformation half-life (days)	617 (the only half-life value available for the combined residue for drinking water modelling) 273 (the only half-life value available for glyphosate for ecological modelling)

Estimated Concentrations in Drinking Water Sources: Level 1 and Level 2 Modelling

A Level 1 drinking water assessment was conducted using conservative assumptions with respect to environmental fate, application rate and timing, and geographic scenario. The Level 1 EEC estimate is expected to allow for future use expansion into other crops at this application rate. Table 1 lists the application information and main environmental fate characteristics used in the simulations.

A number of initial application dates between March and November were modelled. The model was run for 50 years for all scenarios. The largest EECs of all selected runs are reported in Table XI.6 below.

Table XI.6 Level 1 Estimated Environmental Concentrations of the Combined Residue (Glyphosate and AMPA) in Potential Drinking Water

Compound	Groundwater EEC (µg a.i./L)		Surface Water EEC (µg a.i./L)			
			Reservoir		Dugout	
	Daily[1]	Yearly[2]	Daily[3]	Yearly[4]	Daily[3]	Yearly[4]
Glyphosate and AMPA	0	0	299	136	1647	1538

1 90th percentile of daily average concentrations.
2 90th percentile of yearly average concentrations.
3 90th percentile of yearly peak concentrations.
4 90th percentile of yearly average concentrations.

A Level 2 drinking water assessment was conducted using conservative assumptions with respect to environmental fate, but using crop specific application rate and timing, and geographic scenario. The Level 2 EEC estimates are therefore not expected to allow for future use expansion into other crops.

A number of initial application dates between March and November were modelled. The model was run for 50 years for all scenarios. The largest EECs of all selected runs are reported in Table 7 that follows.

Table XI.7 Level 2 Estimated Environmental Concentrations of the Combined Residue (Glyphosate and AMPA) in Potential Drinking Water

Crop	Groundwater EEC (µg a.i./L)		Surface Water EEC (µg a.i./L)			
			Reservoir		Dugout

4 90th percentile of yearly average concentrations.
5 NM – not modelled.

Water Monitoring Data

Glyphosate is registered for use in agriculture, forestry and some domestic uses across Canada. The major environmental transformation product of glyphosate is AMPA (aminomethyl phosphonic acid). Polyoxyethyleneamine (POEA) is used as a surfactant in some end-use products containing glyphosate. POEA has been found to be toxic to aquatic organisms.

A search for water monitoring data on glyphosate, AMPA and POEA was conducted. Canadian water monitoring data on glyphosate and AMPA were available from various relevant regions in several provinces across the country. No Canadian monitoring data were available for the surfactant POEA.

United States databases were also searched for monitoring of glyphosate, AMPA and POEA in water. Data on residues present in water samples taken in the United States are important to consider in the Canadian water assessment given the extensive monitoring programs that exist in the United States. Local weather patterns, runoff events, circumstantial hydrogeology as well as testing and reporting methods are probably more important influences on residue data than Northern versus Southern climate. Regarding climate, if temperatures are cooler, residues may break down more slowly. Alternatively, if temperatures are warmer, growing seasons may be longer and pesticide inputs may be more numerous and frequent.

In the United States, monitoring data were available from the US Geological Survey National Water Quality Assessment program (NAWQA) database, the US Environmental Protection Agency's Storage and Retrieval (STORET) data warehouse, the California Department of Pesticide Regulation database, and some published literature. Neither glyphosate nor AMPA were part of the analyte lists in the US Department of Agriculture Pesticide Data Program (USDA, PDP) and the US Geological Survey National Stream Quality Accounting Network (NASQAN) program. No monitoring data were available for the surfactant POEA in any of the US sources searched.

For the purposes of the drinking water assessment, information was extracted from the available sources, tabulated and sorted into categories as follows:

1. Residues in known drinking water sources (both surface and groundwater).
2. Residues in ambient water that may serve as a drinking water source (both surface and groundwater).
3. Residues in ambient water that are unlikely to serve as a drinking water source.

Discussions and Conclusions

Overall, available data indicate that glyphosate and AMPA are monitored routinely in groundwater and surface waters in many use areas of Canada and the United States.

Glyphosate and AMPA are seldom detected in groundwater. This is expected as both compounds have high Kd and Koc values, and low groundwater ubiquity score (GUS) scores indicating that they bind tightly to soils and do not have a strong propensity to leach into groundwater.

Glyphosate and AMPA are often detected in surface water. This is expected near areas where glyphosate is used as it can easily reach water bodies through drift, runoff (likely sorbed to soil particles), and irrigation canal discharges. Glyphosate is readily soluble in water and is stable to hydrolysis at environmentally relevant pHs. Glyphosate is also not subject to photochemical degradation. The duration of glyphosate and AMPA exposure in water can vary based on several factors, including the amount of organic carbon present in the water body.

The predicted daily and yearly exposure values from the models represent high-end exposure estimates for drinking water that should be considered in the human health dietary risk assessment for acute and chronic exposures, respectively. The highest concentrations detected in surface water samples from sources that may be used as drinking water sources (29 µg/L of glyphosate, 3.8 µg/L of AMPA, or 32.8 µg/L combined) can also be considered in the acute assessment. For the chronic assessment for human health, the yearly concentrations estimated via modelling represent reasonable high-end exposure estimates for drinking water and should be considered in the human health dietary risk assessment. Monitoring data indicate that glyphosate and AMPA are often detected in surface water but at relatively low levels.

For the aquatic risk assessment, the highest detection of glyphosate in surface water (40.8 µg/L) is higher than the peak concentrations predicted by modelling in some scenarios run in water bodies 80 cm and 15 cm deep. As such, this monitoring value (40.8 µg/L) should be considered along with the modelling numbers in the acute assessment for aquatic organisms (both 15 cm and 80 cm depths). The value of 3100 µg/L from the prospective monitoring study could also be considered in the amphibian risk assessment, as a conservative short-term exposure estimate. For longer term exposures, the concentrations estimated via modelling represent reasonable high-end exposure estimates for aquatic habitats. Monitoring data indicate that glyphosate and AMPA are frequently detected in surface water but not at levels that meet or exceed the most sensitive HC_5 from species sensitivity distributions (Amphibians, HC_5 of NOEC from chronic studies: 1800 µg/L).

Appendix XII Proposed Label Amendments for Products Containing Glyphosate

The label amendments presented below do not include all label requirements for individual products, such as first aid statements, disposal statements, precautionary statements and supplementary protective equipment. Information on labels of currently registered products should not be removed unless it contradicts the following label statements.

A) Label Amendments for Glyphosate Technical Products

The following label amendments are required on the Glyphosate Technical labels:

1) Add to the primary panel of the Technical product labels:

   The signal words "DANGER – EYE IRRITANT", and accompanying glyphs.

2) Before **STORAGE section, Add** the title "**ENVIRONMENTAL HAZARDS**" and the following statement:

   - **TOXIC** to non-target terrestrial plants
   - **TOXIC** to aquatic organisms

3) **Remove** the following statement under the "**DISPOSAL AND DECONTAMINATION**"

   "Canadian formulators of this technical should dispose of unwanted active and containers in accordance with municipal or provincial regulations. For information on disposal of unused, unwanted product, contact the manufacturer or the provincial regulatory agency. Contact the manufacturer and the provincial regulatory agency in the case of a spill, and for clean-up of spills."

   and replace it with the following statement:

   "Canadian manufacturers should dispose of unwanted active ingredients and containers in accordance with municipal or provincial regulations. For additional details and clean up of spills, contact the manufacturer or the provincial regulatory agency."

B) For Commercial and Agricultural Class Products Containing Glyphosate

1) Add to DIRECTIONS FOR USE:

   Restricted Entry Intervals

   "The restricted entry interval is 12 hours after application for all agricultural uses."

2) **Add to Use Precautions**

"Apply only when the potential for drift to areas of human habitation or areas of human activity such as houses, cottages, schools and recreational areas is minimal. Take into consideration wind speed, wind direction, temperature inversions, application equipment and sprayer settings."

3) Add the following to ENVIRONMENTAL HAZARDS:

- **TOXIC** to non-target terrestrial plants. Observe buffer zones specified under DIRECTIONS FOR USE.
- **TOXIC** to aquatic organisms. Observe buffer zones specified under DIRECTIONS FOR USE.
- To reduce runoff from treated areas into aquatic habitats, avoid application to areas with a moderate to steep slope, compacted soil or clay.
- Avoid application when heavy rain is forecast.
- Contamination of aquatic areas as a result of runoff may be reduced by including a vegetative strip between the treated area and the edge of the water body.

4) **Add to DIRECTIONS FOR USE**

The following statement is required for all agricultural and commercial pesticide products:

- **As this product is not registered for the control of pests in aquatic systems, DO NOT use to control aquatic pests**
- **DO NOT contaminate irrigation or drinking water supplies or aquatic habitats by cleaning of equipment or disposal of wastes.**

5) Add to **DIRECTIONS FOR USE**

For **field applications using conventional boom sprayers** (agricultural or commercial products), the following statements are required:

Field sprayer application: **DO NOT** apply during periods of dead calm. Avoid application of this product when winds are gusty. **DO NOT** apply with spray droplets smaller than the American Society of Agricultural Engineers (ASAE) medium classification. Boom height must be 60 cm or less above the crop or ground.

For **airblast applications** (agricultural or commercial products), the following statements are required:

Airblast application: **DO NOT** apply during periods of dead calm. Avoid application of this product when winds are gusty. **DO NOT** direct spray above plants to be treated. Turn off outward pointing nozzles at row ends and outer rows. **DO NOT** apply when wind speed is greater than 16 km/h at the application site as measured outside of the treatment area on the upwind side.

For **aerial applications** (agricultural or commercial products) the following statements are required:

Aerial application: **DO NOT** apply during periods of dead calm. Avoid application of this product when winds are gusty. **DO NOT** apply when wind speed is greater than 16 km/h at flying height at the site of application. **DO NOT** apply with spray droplets smaller than the American Society of Agricultural Engineers (ASAE S572.1) coarse classification. To reduce drift caused by turbulent wingtip vortices, the nozzle distribution along the spray boom length **MUST NOT** exceed 65% of the wing | or rotorspan.

Buffer Zones

Use of the following spray methods or equipment **DO NOT** require a buffer zone: hand-held or backpack sprayer and spot treatment.

The buffer zones specified in Tables 1 and 2 that follow are required between the point of direct application and the closest downwind edge of sensitive estuarine/marine habitats.

2004622 2009, Study Report Five Batch Analysis of Glyphosate, DACO: 2.13.3,2.13.4 CBI

2037535 Amended Final Report, DACO: 2.13.1 CBI

2072231 2011, Manufacturing Method, DACO: 2.11 CBI

2072232 2011, Manufacturing Method, DACO: 2.11 CBI

B. Studies Considered for the Toxicological Hazard Assessment

LIST OF STUDIES/INFORMATION SUBMITTED BY REGISTRANT

PMRA Document Number	Reference
1126881	1991, One month feeding study of AMPA administered by capsule to beagle dogs, DACO: 4.7
1126892	1991, 90 Day oral toxicity study of AMPA in dogs, DACO: 4.7
1126903	1993, A developmental toxicity study of AMPA in rats, DACO: 4.5.2
1126905	1991, An evaluation of the potential of AMPA to induce unscheduled DNA synthesis in the in vitro hepatocyte DNA repair assay using the male F-344 rat, DACO: 4.5.4
1149395	1993, Correspondence: re- 90 day dog study with AMPA, DACO: 4.7
1149396	1991, 90-day oral (capsule) toxicity study in dogs with AMPA. Missing pages requested as per letter dated October 4,1993, DACO: 4.7
1149397	1991, Results of the stability analyses of AMPA (aminomethyl phosphonic acid) test material used in a 90 day dog study at Wil laboratories, DACO: 4.7
1156204	1994, A mouse micronucleus study of AMPA, DACO: 4.5.4
1161752	1991, Assessment of acute oral toxicity of (n-methyl-n-phosphonomethyl)glycine to rats (glyphosate), DACO: 4.2.1
1161753	1993, AMPA: acute oral toxicity (limit) test in rats, DACO: 4.2.1
1161755	1993, AMPA: acute dermal toxicity (limit) test in rats, DACO: 4.2.2
1161756	1989, Glyphosate technical: acute dermal toxicity (limit) test in rats, DACO: 4.2.2
1161758	1989, Glyphosate technical acute inhalation toxicity study in rats (limit test), DACO: 4.2.3
1161760	1989, Glyphosate technical: primary eye irritation test in rabbits, DACO: 4.2.4
1161761	1989, Compound No.3607: primary eye irritation test in rabbits (glyphosate), DACO: 4.2.4
1161763	1989, Glyphosate technical: primary skin irritation test in rabbits, DACO: 4.2.5
1161765	1989, Glyphosate technical: Magnusson-Kligman maximisation test in guinea pigs, DACO: 4.2.6
1161766	1992, AMPA: Magnusson-Kligman maximisation test in guinea pigs, DACO: 4.2.6
1161768	1989, Glyphosate 4 week dietary toxicity study in rats, DACO: 4.3.1
1161769	1993, AMPA 13 week toxicity study in rats with administration by gavage, DACO: 4.3.1
1161775	1991, Assessment of acute oral toxicity of "glyphosate technical" to mice, DACO: 4.2.1
1161777	1989, Glyphosate 13 week dietary toxicity study in rats, DACO: 4.3.1
1161778	1991, The effect of glyphosate on pregnancy of the rat (incorporates preliminary investigation), DACO: 4.5.2

1161779 1991, The effect of glyphosate on pregnancy of the rabbit (incorporates preliminary investigation), DACO: 4.5.2

1161780 1993, Mutagenicity test: in vitro mammalian cell gene mutation test performed with mouse lymphoma cells (L5178Y) test compound: AMPA, DACO: 4.5.4

1161781 1991, Mutagenicity test: in vitro mammalian cell gene mutation test with glyphosate, DACO: 4.5.4

1161782 1993, Mutagenicity test: Ames salmonella test with AMPA, DACO: 4.5.4

1161783 1993, Mutagenicity test: micronucleus test with AMPA, DACO: 4.5.4

1161784 1991, Mutagenicity test: micronucleus test with glyphosate, DACO: 4.5.4

1161785 1991, Mutagenicity test: Ames salmonella assay with glyphosate, DACO: 4.5.4

1161786 1993, Glyphosate 104 week dietary carcinogenicity study in mice, DACO: 4.4.1,4.4.2

1161787 1989, Glyphosate 13 week dietary toxicity study in mice, DACO: 4.3.1

1161788 1990, Glyphosate 52 week oral toxicity study in dogs, DACO: 4.3.1

1161790 1993, Glyphosate 3 week toxicity study in rats with dermal administration, DACO: 4.3.4

1161791 1993, AMPA 4 week dose range finding study in rats with administration by gavage, DACO: 4.3.8

1161793 1992, The effect of dietary administration of glyphosate on reproductive function of two generations in the rat. Volumes I and II, DACO: 4.5.1

1161794 1992, AMPA teratogenicity study in rats, DACO: 4.5.2

1161795 1993, Glyphosate 104 week dietary carcinogenicity study in mice. DACO: 4.4.1,4.4.2

1161796 1993, Glyphosate 104 week combined chronic feeding/oncogenicity study in rats with 52 week interim kill.(results after 104 weeks), DACO: 4.4.1, 4.4.2

1161797 1993, Glyphosate 104 week combined chronic feeding/oncogenicity study in rats with 52 week interim kill.(results after 104 weeks), DACO: 4.4.1, 4.4.2

1161798 1993, Glyphosate 104 week combined chronic feeding/oncogenicity study in rats with 52 week interim kill. (Results after 52 weeks) + addendum individual body weight (g) and food consumption per cage of rats: males and females, DACO: 4.4.1, 4.4.2

1182530 1973, The dynamics of accumulation and depletion of orally ingested n-phosphonomethylglycine-^{14}C, DACO: 4.5.9

1184695 1972, Acute oral toxicity study with CP67573 in albino rabbits, DACO: 4.2.1

1184722 1979, Ninety-day subacute toxicity test with aminomethylphosphonic acid CP50435 in rats, DACO: 4.3.1

1184726 1980, Technical glyphosate: teratology study in rats, DACO: 4.5.2

1184727 1980, Technical glyphosate: teratology study in rabbits, DACO: 4.5.3

1184728 1980, Technical glyphosate: dominant lethal study in mice, DACO: 4.5.4

1184795 1972, Ninety-day subacute oral toxicity study with CP67573 in beagle dogs, DACO: 4.7

1184837 1981, A lifetime feeding study of glyphosate (roundup technical) in rats, DACO: 4.4.1, 4.4.2

1184838 1981, A lifetime feeding study of glyphosate (roundup technical) in rats, DACO: 4.4.1, 4.4.2

1184839 1981, A lifetime feeding study of glyphosate (roundup technical) in rats, DACO: 4.4.1, 4.4.2
1184851 1978, Acute oral toxicity study in rats. Compound: glyphosate technical, DACO: 4.2.1
1184852 1979, Acute dermal toxicity study LD_{50} in rabbits. Compound: glyphosate technical, DACO: 4.2.2
1184853 1979, Rabbit eye irritation study. Compound: glyphosate technical, DACO: 4.2.4
1184879 1982, A chronic feeding study of glyphosate (roundup technical) in mice, DACO: 4.4.1, 4.4.2
1184946 1973, Final report on CP67573 residue and metabolism, part 13: the dynamics of accumulation and depletion of orally ingested n-phosphonomethylglycine-^{14}C, DACO: 4.5.9
1184958 1973, Final report on CP67573 residue and metabolism, part 8: the gross metabolism of n-phosphonomethylglycine-^{14}C (cp67573-^{14}C) in the laboratory rat following a single dose, DACO: 4.5.9
1184959 1973, Final report on CP67573 residue and metabolism, part 9: the gross distribution of n-phosphonomethylglycine-^{14}C (cp67573-^{14}C) in the rabbit, DACO: 4.5.9
1184960 1973, Final report on CP67573 residue and metabolism, part 11: the metabolism of aminomethylphosphonic acid-^{14}C (CP50435-^{14}C) in the laboratory rat, DACO: 4.5.9
1184961 1973, Final report on CP67573 residue and metabolism, part 12: the isolation and identification of the metabolites of CP67573-^{14}C excreted by the laboratory rat, DACO: 4.5.9
1202148 1985, Twelve month study of glyphosate administered by gelatin capsule to beagle dogs. DACO: 4.4.1
1211998 1996, Glyphosate acid: acute oral toxicity study in rats, DACO: 4.2.1
1211999 1996, Glyphosate acid: acute dermal toxicity study in the rat, DACO: 4.2.2
1212000 1996, Glyphosate acid: 4-hour acute inhalation toxicity study in rats, DACO: 4.2.3
1212001 1997, Glyphosate acid: eye irritation to the rabbit, DACO: 4.2.4
1212002 1996, Glyphosate acid: skin irritation to the rabbit, DACO: 4.2.5
1212003 1996, Glyphosate acid: skin sensitisation to the guinea pig, DACO: 4.2.6
1212004 1996, First revision to glyphosate acid: 90 day feeding study in rats, DACO: 4.3.1
1212005 1996, First revision to glyphosate acid: 90 day oral toxicity study in dogs, DACO: 4.3.2

1184857	1979, Glyphosate Residues in Potatoes Following Pre-emergent Treatment with Roundup Herbicide; Final Report, Report# MSL-0677; Information to support the use of Roundup (13644 PCP Act) as a preplant treatment on potatoes and sugar beets.
1184858	1979, Glyphosate Residues in Sugar Beets Following Pre-emergent Treatment with Roundup Herbicide; Final Report, Report# MSL-0690; Information to support the use of Roundup (13644 PCP Act) as a preplant treatment on potatoes and sugar beets.
1184868	1974, Final Report on CP67563: Residue and Metabolism, Part 21: Determination of CP67573 and CP50435 Residues in Grapes; Agricultural Research Report# 337; Information to support the establishment of permanent tolerances and label registration of Roundup for weed control in grapes.
1184869	1974, Final Report on CP67573, Residue and Metabolism, Part 20: The Metabolism of CP67573 in Grape Plants. Agricultural research Report# 335; Information to support the establishment of permanent tolerances and label registration of Roundup for weed control in grapes; Special Report# 340.
1184871	Section F: Proposed Tolerance for CP67573, N-(phosphonomethyl)glycine (Roundup). Information to support the establishment of permanent tolerances and label registration of Roundup for weed control in grapes; Special Report# 340.
1184876	Residues of Roundup (CP67573) and Roundup metabolite (CP50435) in barley forage, straw, barley grain, oat forage, straw, and oat grain using a single pre-emergent application.
1184887	1974, Final Report on CP67573, Residue and Metabolism Part 17: Determination of crop residues in corn, wheat, soybeans, small grains, soil and water; Agricultural Research Report No. 325; Special Report# 334.
1184888	1974, Final Report on CP67573, Residue and Metabolism, Part 10: The Metabolism of CP67573 in Soybeans, Cotton, Wheat and Corn; Information to support the establishment of permanent tolerances and label registration for the use of Roundup as a preplant herbicide on corn (all types), soybeans, wheat and other small grains; Agricultural Research Report# 304; Special Report# 334.

1184915 1974, Summary of CP67573 (Roundup) Residue Studies in Crops, Animals, Soil, Water; Information to support the establishment of permanent tolerances and label registration for the use of Roundup as a preplant herbicide on corn (all types), soybeans, wheat and other small grains; Special Report# 334.

1184920 1979, A Short Residue Method for Glyphosate Active Ingredient in Roundup Herbicide; the short method for glyphosate has been evaluated in the following crops: oranges, lemons + soybean (grain) + soybean (hay) + rice (grain) + pecans + grapes + tomatoes + lettuce + asparagus + avocados and in environmental water: Sphagnum Bog water + Day Lake water.

1184921 Glyphosate Residue in Pome Fruits, November 15, 1977.

1184924 1974, Final Report on CP67573, Residue and Metabolism, Part 18: Determination of residues in meat, milk and eggs; Agricultural Research Report# 326; Information to support the establishment of permanent tolerances and label registration for the use of Roundup as a preplant herbicide on corn (all types), soybeans, wheat and other small grains, Conkin R. et al.; Special Report# 334.

1184926 1974, Proposed Tolerances for CP67573, N-(phosphonomethyl)glycine (Roundup). Information to support the establishment of permanent tolerances and label registration for the use of Roundup as a preplant herbicide on corn (all types), soybeans, wheat and other small grains, Conkin R. et al.; Special Report# 334.

1184935 1973, Milk and Tissue Residue Study with N-(phosphonomethyl)glycine (CP67573) in the Cow. Information to support the establishment of permanent tolerances and label registration for the use of Roundup as a preplant herbicide on corn (all types), soybeans, wheat and other small grains, Conkin R. et al.; Special Report# 334.

1184956 1974, Summary of CP67573 Metabolism Studies in Plants and Animals: Information to support the establishment of permanent tolerances and label registration for the use of Roundup as a preplant herbicide on corn (all types), soybeans, wheat and other small grains; Special Report# 334.

1184956 1974, Summary of CP67573 Metabolism Studies in Plants and Animals: Information to support the establishment of permanent tolerances and label registration for the use of Roundup as a preplant herbicide on corn (all types), soybeans, wheat and other small grains; Special Report# 334.

1188502 1997, Residue Analytical Method for the Determination of the Trimethylsulfonium Cation of Glyphosate-trimesium in Crops, Zeneca Agrochemicals, Report# SOP RAM 299/01.

1194109 Waiver Request - No data were provided for residue review since the surfactant is an alkyl amine ethoxylate, substantially similar to those currently used in glyphosate registered products; no significant difference in the fate or magnitude of the residues of glyphosate resulting from the application of MON 77569 are expected, and all resulting residues are expected to be within currently established limits.

1195776 1996, Residues of Glyphosate and AMPA in Beet Containing the Roundup Ready Gene, following Multiple Applications with MON 52276 Herbicide, UK Field Trials, 1995, Report# MLL-30453; RD 1384, 295 pages.

1199094 Summary: Glyphosate residues in cranberries.

1199095 Crop residue data: Cranberry fruit, 1978.

1199096 Crop residue data: Cranberry fruit, 1980.

1199097 Crop residue data: Cranberry fruit, 1979.

1199098 Residue Analysis: Cranberry fruit, 1981.

1213191 2002, Comprehensive Data Summaries: Tier II Summary: Metabolism Data, DACO Part 6, Glyphosate Acid, 18 pages.

1213191 2002, Comprehensive Data Summaries: Tier II Summary: Metabolism Data, DACO Part 6, Glyphosate Acid, 18 pages.

1213192 1994, [14C-PMG] Glyphosate-Trimesium: Nature of the Residue in Tissues and Eggs of Laying Hens (WRC-93-089); Report Series RR 93-064B.

1213194 1994, The Nature of Residues of Orally Administered [Phosphonomethylene-14C] Glyphosate-Trimesium in Goat Tissues and Milk (WRC-93-088); Report Series RR 93-062B.

1213195 1999, Touchdown: Determination of Glyphosate N-(phosphonomethyl)glycine and Aminomethylphosphonic Acid in Animal Products by Gas Chromatography and Mass-Selective Detection (a Revised Method), Report# RR 93-104B RES ADD1, 94 pages.

1213196 1992, [14C-Anion] ICIA0224 - Nature of the Residue: Soybeans (WRC-91-189), Unpublished study prepared by ICI Western Research Center, Report# 6.3-1; RR 91-092B, PMS 304, 82 pages.

1213197 1991, Glyphosate-Trimesium: Uptake and Metabolism in USA Grape Vines, Unpublished study prepared by ICI Jealott's Hill Research Center, Report# 6.3-2, RJ 1002B, 105 pages.

1213198 1990, ICIA0224: Uptake and Metabolism in Grape Vines, Report# 6.3-3, RJ 0815B.

1213199 1989, ICIA0224: Metabolism on Wheat Following a Pre-Harvest Foliar Spray, Report# 6.3-4, RJ 0778B.

1224458 1985, Glyphosate Residues in Canadian Wheat and Barley following preharvest application with Roundup Herbicide, Report# MSL-5103.

1224459 1984, Glyphosate Residues in Wheat and Wheat grain milling/fractionation products following preharvest application with Roundup Herbicide, Report# MSL-3677.

1224459 1984, Glyphosate Residues in Wheat and Wheat grain milling/fractionation products following preharvest application with Roundup Herbicide, Report# MSL-3677.

1224460	1984, Residual Aminomethylphosphonic Acid (AMPA) in Preharvest Roundup Herbicide Treated Crops, Ref. # R 10293.
1224461	1983, Residue Analysis for Glyphosate and AMPA in Brassica Seed Crops and Processed Fractions following preharvest Roundup Herbicide treatments, Report# MLL 30.104.
1224461	1983, Residue Analysis for Glyphosate and AMPA in Brassica Seed Crops and Processed Fractions following preharvest Roundup Herbicide treatments, Report# MLL 30.104.
1224462	1986, Glyphosate residues in Roundup herbicide preharvest treated cereals, rapeseed, beans, peas, grass, hay and silage, Report# MLL 30.155 (Volume 1 of 2).
1224463	1986, Glyphosate residues in Roundup herbicide preharvest treated cereals, rapeseed, beans, peas, grass, hay and silage , report# MLL 30.155 (Volume 2 of 2).
1224464	1983, Glyphosate residues in beans following Roundup herbicide preharvest application, Report# MLL 30.109.
1224466	1988, Glyphosate Residues in Canadian Soybeans, Report# MSL-8120.
1224467	1987, Glyphosate residues in processed fractions obtained from preharvest Roundup herbicide treated wheat, barley and oat, Report# MLL 30.179.
1224469	1981, Residual glyphosate in processed wheat grains following a preharvest application of Roundup herbicide in the United Kingdom, Report# MLL 30 069.
1224470	1981, Residual glyphosate in processed barley grains following a preharvest application of Roundup herbicide in the United Kingdom, Report# MLL 30 070.
1224471	1988, Uptake and persistence of the herbicide glyphosate (Roundup) in fruit of wild blueberry and red raspberry, Canadian Forestry Service Program of Research by the Universities in Forestry, DSS Contract # 01K38-5-0023.
1224472	Glyphosate Residues in Forage Legumes and Grasses Following Pre-emergent Treatment with Roundup Herbicide; Monsanto Company.
1224473	1976, Glyphosate Residues in Green and dry Alfalfa following pre-emergent treatment with Roundup herbicide, Report# 428.
1224474	1976, Glyphosate Residues in sugar beets following pre-emergent treatment with Roundup herbicide, Report# 430.
1224476	1976, Glyphosate residues in nuts following post directed treatments with Roundup herbicide, Report# 442.
1224477	1977, Glyphosate residues in seed, pod, leafy and root crop vegetables following pre-emergent treatment with Roundup herbicide, Report# 470.
1224478	1986, Information to support the use of Roundup herbicide applied preharvest to soybeans with glyphosate residue in soybeans and soybean fractions, Report# MSL-4671 (Part 1).

1224478	1986, Information to support the use of Roundup herbicide applied preharvest to soybeans with glyphosate residue in soybeans and soybean fractions, Report# MSL-4671 (Part 1).
1224712	1986, Information to support the use of Roundup herbicide applied preharvest to soybeans with glyphosate residue in soybeans and soybean fractions, Report# MSL-4671 (Part 2).
1224712	1986, Information to support the use of Roundup herbicide applied preharvest to soybeans with glyphosate residue in soybeans and soybean fractions, Report# MSL-4671 (Part 2).
1229171	1989, Glyphosate and AMPA Residues in Canadian Canola and Flax following preharvest applications of Roundup herbicide, Report# MSL-9049.
1229281	1989, Glyphosate Residues in Wheat grain and Straw after Preharvest Treatment with Roundup Herbicide (Addendum), Report# MSL-8959.
1230385	1989, Glyphosate Residues in Canadian barley grain and straw following preharvest application of Roundup herbicide, Report# MSL-9458.
1230386	1989, Glyphosate and AMPA residues in Canadian field peas and lentils following preharvest applications of Roundup herbicide, Report# MSL-9398.
1237190	1989, Metabolism of [14C-Cation] ICIA 0224 in Corn (WRC-89-143), Report# RR 89-011B.
1237192	1989, Metabolism of [14C-Anion] ICIA 0224 in Corn (WRC-89-142), Report# RR 89-010B.
1237193	1986, SC-0224 [14C-TMS] – Nature of the Residue: Soybeans, Lab# PMS-221, Project# MRC-86-14.
1237194	1986, SC-0224 [14C]CAP (Anion), Nature of the Residue: Soybeans, Lab# PMS-222, Project# MRC-86-16.
1241185	1997, Determination of Residues of YRC 2894 480 SC Following Spray Application on Apple (Fruit, Juice, Pomace, Sauce, Fruit washed, Fruit dried) in Italy, Report# PF-E/MR; RA-3063/95.
1241232	1997, Determination of Residues of YRC 2894 480 SC Following Spray Application on Apple (Fruit, Juice, Pomace, Sauce, Fruit, washed, Fruit, dried) in the Federal Republic of Germany, Report# PF-E/MR; RA-3062/95.
1249914	1984, Glyphosate Residues in Tomato Fruit from Canada following Pre-Plant Treatment with Roundup, Report# MSL-4425.
1249915	HPLC-Fluorometric Method for the Analysis of Glyphosate and Aminomethylphosphonic Acid in Tomatoes, Monsanto Company, 22 pages.
1255946	USEPA Review: Residue data submitted in support of minor use of Roundup/Roundup Dry/Roundup Transorb to control weeds on sugar beets; USEPA Memo, 8/26/97.

1325636	2005, Magnitude of Glyphosate Residues in Roundup Ready Sugar Beet Raw Agricultural Commodities Following Applications of a Glyphosate-Based Formulation, Canada Trials, Report# MSL-19260.
1367768	Request for FREAS Comment on Glyphosate Residues in Roundup Ready® Alfalfa, Monsanto Canada Inc., 3 pages.
1367769	Summary: Glyphosate residue in/on alfalfa hay as a result of the pre-harvest application of Roundup herbicide, Monsanto Canada Inc., Report# MSL-12617, 2 pages.
1380219	2006, Tier II Summary: Environmental Chemistry and Fate Data. Includes Appendix 1-4: Glyphosate Acid Technical Herbicide – Physical and Chemical Properties of Pure Material, Syngenta Crop Protection Canada, Inc., 2/28/06, 125 pages, unpublished.
1407428	Summary: Food, feed and tobacco residue studies to support use of Roundup WeatherMax With Transorb 2 Technology Liquid Herbicide in Roundup Ready2 Yield soybeans for control of alfalfa and bromegrass and suppression of field horsetail, Sub# 2007-3205, 06-Apr-2007.
1443091	2007, Magnitude of Glyphosate Residues in Roundup Ready® Soybean Raw Agricultural Commodities Following Sequential Applications of a Glyphosate-Based Formulation at the V3 and R1-R2 Growth Stages, Monsanto Company, Report# MSL-0020883, 660 pages.
1552809	2007, Analytical Method for the Determination of N-acetylglyphosate and Other Analytes in Various Animal Matrices Using LC/MS/MS. Project Identification No. DuPont-20009. Unpublished study prepared by DuPont, 96 pages.
1552811	2007, Independent Laboratory Validation of DuPont-15444, “Analytical Method for the Determination of Glyphosate and Relevant Metabolite Residues in Various Crop Matrices Using LC/MS/MS”; Report# DuPont-21313. Unpublished study prepared by DuPont, 101 pages.
1552814	2007, Independent Laboratory Validation of DuPont-20009, “Analytical Method for the Determination of N-Acetylglyphosate and other Analytes in Various Animal Matrices Using LC/MS/MS.” Report# DuPont-21372. Unpublished study prepared by DuPont, 172 pages.
1552816	2007, Method Assessment and Validation of PAM Multi-Residue Method for the Determination of N-acetylglyphosate. Report# DuPont-21373. Unpublished study prepared by DuPont, 84 pages.
1552818	2007, The Metabolism of [14C]Glyphosate in gat/gm-hra (DP-356Ø43-5, PHP20163a) Soybeans. Study No. DuPont-19530. Unpublished study prepared by E.I. du Pont de Nemours and Company, 86 pages.

1552819 2007, Metabolism of [14C]-N-Acetylglyphosate (IN-MCX20) in Laying Hen. Study No. DuPont-19795. Unpublished study prepared by E.I. du Pont de Nemours and Company, 73 pages.

1552821 2007, Metabolism of [14C]-N-Acetylglyphosate (IN-MCX20) in the Lactating Goat. Study No. DuPont-19796. Unpublished study prepared by E.I. du Pont de Nemours and Company, 82 pages.

1552822 2007, Magnitude of Residues of N-Acetylglyphosate and Degradates in Laying Hen Tissues and Eggs. Unpublished study prepared by E.I. DuPont de Nemours and Company. Study Number: DuPont-20088, 227 pages.

1552825 2007, Magnitude of Residues of N-Acetylglyphosate and Degradates in Dairy Cow Tissues and Milk. Unpublished study prepared by E.I. du Pont de Nemours and Company; Report# DuPont-20087, 221 pages.

1552833 2007, Magnitude of the Residues of Glyphosate and Metabolites in Aspirated Grain Fractions (AGF) and Processed Fractions (Refined Oil, Meal, and Hulls) of a Soybean Line Containing Event DP-356Ø43-5 Following Applications of Glyphosate Containing Herbicides - United States Locations, Season 2006. DuPont Study No: DuPont-19835. Unpublished study prepared by DuPont, 151 pages.

1552834 2007, Aminomethylphosphonic acid (AMPA) in/on soybean processed fractions (meal, hulls and refined oil) of a soybean line containing event DP-356Ø43-5 following applications of a commercial glyphosate formulation – Chile location, E. I. du Pont de Nemours and Company, DuPont Report Number: DuPont-20093, 53 pages.

1552835 2006, Stability of Glyphosate, N-Acetylglyphosate and Aminomethyl Phosphonic Acid in GAT Soybean Forage, Seed and Hay Stored Frozen: Interim Report. DuPont Study No: DuPont-17573. Unpublished study prepared by DuPont, 81 pages.

1552841 2007, Toxicological assessment of N-acetyl aminomethylphosphonic acid (IN-EY252) – Rationale for non-inclusion in glyphosate tolerance expression, E. I. du Pont de Nemours and Company, Report# DuPont-22309, Revision No. 1, 18 pages.

1584178 2007, Analytical Method for the Determination of Glyphosate and Degradate Residues in Various Crop Matrices Using LC/MS/MS. Project Identification No. DuPont-15444, Revision No.1. Unpublished study prepared by DuPont, 126 pages.

1594057 2008, Touchdown Total on Glyphosate Tolerant Corn: Rationale For Use of Waiver of Additional Residue Studies to Support a Registration. DACO Part 7.4.1: Food, Feed and Tobacco Residue Studies (EP) USC #14, Syngenta Crop Protection Canada, Inc., 5 pages.

1608202 2007, The Metabolism of [14C] Glyphosate in Optimum GAT (Event DP-Ø9814Ø-6) Field Corn. Study No. DuPont-19529. Unpublished study prepared by E.I. du Pont de Nemours and Company, 70 pages.

1608205 2007, Analytical Method for the Determination of N-Acetylglyphosate and Other Analytes in Various Animal Matrices using LC/MS/MS, Report# DuPont-20009.

1608207 2007, Magnitude of Residues of Glyphosate and its Degradates in/on Field Corn forage, Grain, and Stover of Hybrid Corn Line 49712 containing the GAT Gene from Event DP-049712-7 Following Applications of Glyphosate Herbicides at Maximum Label Rates - United States Locations, Season 2005, Report# DuPont-16701, Revision No.1.

1608224 2007, Magnitude of Residues of Glyphosate and Degradates in Aspirated Grain and Processed Fractions (Starch, Grits, Flour, Refined Oil (Wet Milling) Refined Oil (Dry milling) and Meal (Dry Milling) of a Field Corn Line Containing Event DP-098140-6 Following Application of Glyphosate Containing Herbicides - United States and Canadian Locations, Season 2006, Report# DuPont-19836
.

1735244 2008, Magnitude and Decline of Residues of Glyphosate and Its Degradates in/on Forage, Hay and Seed of a Soybean Line Containing Event DP-356Ø43-5 Containing the GAT and GM-HRA Genes Following a Variety of Tank Mix Applications of Glyphosate Herbicides and Sulfonylurea Herbicides (Rimsulfuron, Tribenuron Methyl, Chlorimuron Ethyl, and Metsulfuron Methyl) at Maximum Label Rates - United States and Canadian Locations, Season 2006 [Final Report]. DuPont Study No: DuPont-20123 Volume 1 of 3. Unpublished study prepared by DuPont, 347 pages.

1735245 2008, Magnitude and Decline of Residues of Glyphosate and Its Degradates in/on Forage, Hay and Seed of a Soybean Line Containing Event DP-356Ø43-5 Containing the GAT and GM-HRA Genes Following a Variety of Tank Mix Applications of Glyphosate Herbicides and Sulfonylurea Herbicides (Rimsulfuron, Tribenuron Methyl, Chlorimuron Ethyl, and Metsulfuron Methyl) at Maximum Label Rates - United States and Canadian Locations, Season 2006 [Final Report]. DuPont Study No: DuPont-20123 Volume 2 of 3. Unpublished study prepared by DuPont, 346 pages.

1735248 2008, Magnitude and Decline of Residues of Glyphosate and Its Degradates in/on Forage, Hay and Seed of a Soybean Line Containing Event DP-356Ø43-5 Containing the GAT and GM-HRA Genes Following a Variety of Tank Mix Applications of Glyphosate Herbicides and Sulfonylurea Herbicides (Rimsulfuron, Tribenuron Methyl, Chlorimuron Ethyl, and Metsulfuron Methyl) at Maximum Label Rates - United States and Canadian Locations, Season 2006 [Final Report]. DuPont Study No: DuPont-20123 Volume 3 of 3. Unpublished study prepared by DuPont, 124 pages.

1739972 2007, Magnitude and Decline of Glyphosate and Its Degradates in/on Green Plant, Forage, Stover and Grain of a Corn Line Containing Event DP-098140-6 GAT and ZM-HRA Genes Following a Variety of Tank Mix Applications of Two Gyphosate and Rimsulfuron, Tribenuron Methyl, Chlorimuron Ethyl, and Metsulfuron Methyl Containing Herbicides at Maximum Label Rates – United

States and Canadian Locations, Season 2006. DuPont Study No. DuPont-20122 Volume 1 of 3. Unpublished study prepared by E.I. Dupont, 345 pages.

1739973 2007, Magnitude and Decline of Glyphosate and Its Degradates in/on Green Plant, Forage, Stover and Grain of a Corn Line Containing Event DP-098140-6 GAT and ZM-HRA Genes Following a Variety of Tank Mix Applications of Two Gyphosate and Rimsulfuron, Tribenuron Methyl, Chlorimuron Ethyl, and Metsulfuron Methyl Containing Herbicides at Maximum Label Rates – United States and Canadian Locations, Season 2006. DuPont Study No. DuPont-20122 Volume 2 of 3. Unpublished study prepared by E.I. Dupont, 368 pages.

1739974 2007, Magnitude and Decline of Glyphosate and Its Degradates in/on Green Plant, Forage, Stover and Grain of a Corn Line Containing Event DP-098140-6 GAT and ZM-HRA Genes Following a Variety of Tank Mix Applications of Two Gyphosate and Rimsulfuron, Tribenuron Methyl, Chlorimuron Ethyl, and Metsulfuron Methyl Containing Herbicides at Maximum Label Rates – United States and Canadian Locations, Season 2006. DuPont Study No. DuPont-20122 Volume 3 of 3. Unpublished study prepared by E.I. DuPont, 368 pages.

1739976 Response to Deficiency Letter Issued March 25, 2009 for Submission Numbers 2008-2269 and 2008-2270 – DACO 7.3 "Freezer Storage Stability", 3 pages.

1754236 2009, Stability of Glyphosate, N-Acetylglyphosate, Aminomethyl Phosphonic Acid and N-Acetyl AMPA in GAT Soybean Forage, Seed, and Hay Stored Frozen. DuPont Study No. DuPont-17573. Unpublished study prepared by DuPont, 119 pages.

1767015 1993, Magnitude of Glyphosate Residues Following Preharvest Use in Milo Raw Agricultural Commodities, Monsanto Company, Report# MSL-13037, RD 1192 Volume 2 of 3, 353 pages.

1767016 1994, Magnitude of Glyphosate Residues in Milo Processed Commodities Following Preharvest Use of Roundup Herbicide, Monsanto Company, Report# MSL-13038, RD 1192 Volume 3 of 3, 295 pages.

1767017 1998, Magnitude of Glyphosate Residues in Grain Sorghum Raw Agricultural Commodities Following Preharvest Application of Roundup UltraTM Herbicide, Monsanto Company, Report# MSL-14918, 269 pages.

1799876 2009, Stability of Glyphosate and Metabolites in Corn Green Plant, Forage, Grain, and Stover Containing the GAT and ZM-HRA Genes During Frozen Storage; Report# DuPont-20094, 160 pages.

1808247 2009, Magnitude of Glyphosate Residues in Sweet Corn Raw Agricultural Commodities Obtained from Roundup Ready Corn 2 ® Technology Following Applications of a Glyphosate-Based Formulation, U.S. and Canada 2008 Trials. Monsanto Company, Environmental Sciences Technology Center, Report# MSL0021170, 428 pages.

1808249 2009, Summary:Magnitude of Glyphosate Residues in Sweet Corn Raw Agricultural Commodities Obtained from Roundup Ready Corn 2 ® Technology Following Applications of a Glyphosate-Based Formulation, U.S. and Canada 2008 Trials. Monsanto Company, Environmental Sciences

Technology Center, Report# MSL0021170, 3 pages.

1833850 2009, Summary: Magnitude of Glyphosate Residues in Corn Raw Agricultural Commodities Following Applications of a Glyphosate-Based Formulation to Roundup Hybridization System (RHS) Seed Corn. U.S. 2008 Trials, Monsanto Company, Report# MSL0022293, 3 pages.

1878829 1993, Summary: Glyphosate Residues in Alfalfa Hay Following Pre-harvest Treatments with Roundup Herbicide in Canada during the 1992 Growing Season, Monsanto Company, Report# MSL-12617, 3 pages.

1878830 2002, Summary: Magnitude of Glyphosate Residues in Roundup Ready Alfalfa Raw Agricultural Commodities Following Topical Application of Roundup Ultra Herbicide, Monsanto Company, Report# MSL-16761, 16 pages.

1879045 2010, Residue Data Waiver Rationale - Glyphosate on Mustard, 3/17/10.

1879046 PMRA Response to PMRA# 1879045.

1924479 2009, Summary: Magnitude of Glyphosate Residues in corn Raw Agricultural Commodities Following Topical Application of a Glyphosate Based Formulation to Roundup Hybridization System (RHS) Seed Corn. US 2008 Trials, Monsanto Company, Report# MSL0022293, 4 pages, submitted by Neyedley B, 12/10/09.

1924480 2009, Magnitude of Glyphosate Residues in Corn Raw Agricultural Commodities Following Applications of a Glyphosate-Based Formulation to Roundup Hybridization System (RHS) Seed Corn. U.S. 2008 Trials, Monsanto Company, Report# MSL0022293, 353 pages.

1924502 Summary: Magnitude of Glyphosate Residues in Roundup Ready Alfalfa Raw Agricultural Commodities Following Topical Application of a Glyphosate-Based Formulation. Canada 2008 Trials, Monsanto Company, Report# MSL0021171, 3 pages.

1924503 2010, Magnitude of Glyphosate Residues in Roundup Ready® Alfalfa Raw Agricultural Commodities Following Topical Application of a Glyphosate-Based Formulation. Canada 2008 Trials, Monsanto Company, Report# MSL0021171, 268 pages.

1924504 Summary: Magnitude of Glyphosate Residues in Roundup Ready Alfalfa Raw Agricultural Commodities Following Topical Application of a Glyphosate-Based Formulation. United States Studies, Monsanto Company, Report# MSL-16761, 4 pages.

1924505 2002, Magnitude of Glyphosate Residues in Roundup Ready® Alfalfa Raw Agricultural Commodities Following Topical Application of Roundup Ultra® Herbicide, Monsanto Company, Report# MSL-16761, 512 pages.

2006672 2009, Analytical Method for the Determination of Glyphosate and Degradate Residues in Various Crop Matrices Using LC/MS/MS. Project Identification No. DuPont-15444, Revision No.3. Unpublished study prepared by DuPont, 132 pages.

2006674 2010, Magnitude and Decline of Glyphosate Related Residues in Forage and Seed of Genetically Modified Canola Event DP-Ø73496-4 and Magnitude of Glyphosate Related Residues in Canola Event DP-Ø73496-4 Seed Process Fractions Following Applications of Touchdown Total® Herbicide – Locations in the United States and Canada, Season 2009; Final Study Report. Project Numbers: DuPont-27816, ABC Laboratories 64515, Pioneer PHI-2009-057. Unpublished study prepared by ABC Laboratories, Inc. 513 pages (Volume 1 of 2).

2006677 2010, Magnitude and Decline of Glyphosate Related Residues in Forage and Seed of Genetically Modified Canola Event DP-Ø73496-4 and Magnitude of Glyphosate Related Residues in Canola Event DP-Ø73496-4 Seed Process Fractions Following Applications of Touchdown Total® Herbicide – Locations in the United States and Canada, Season 2009; Final Study Report. Project Numbers: DuPont-27816, ABC Laboratories 64515, Pioneer PHI-2009-057. Unpublished study prepared by ABC Laboratories, Inc. 513 pages (Volume 2 of 2).

2013875 2010, The Metabolism of [14C] Glyphosate in 0827 Canola. Lab Project No. 808685; Report# DuPont-26109. Unpublished study conducted by Charles River Laboratories, 74 pages.

2025578 2011, Summary: Overview and Tolerance Proposals for Glyphosate Residues in Glyphosate Tolerant Canola Raw Agricultural Commodities Following Applications of a Glyphosate-Based Formulation (Overview of Full Study MRID Nos. 48358101, 48358102, and 48358103), Monsanto Company, Report# MSL0023286 (MRID 48358105), 10 pages.

2025580 2011, OECD Tier II Study Summary: Magnitude of Glyphosate Residues in Glyphosate Tolerant Canola Raw and Processed Agricultural Commodities Following Applications of a Glyphosate-Based Formulation (Correlates to Full Study MRID Nos. 48358101, 48358102, and 48358103), Monsanto Company, Report# MSL0023285 (MRID 48358104), 20 pages.

2025580 2011, OECD Tier II Study Summary: Magnitude of Glyphosate Residues in Glyphosate Tolerant Canola Raw and Processed Agricultural Commodities Following Applications of a Glyphosate-Based Formulation (Correlates to Full Study MRID Nos. 48358101, 48358102, and 48358103), Monsanto Company, Report# MSL0023285 (MRID 48358104), 20 pages.

2025582 2011, Magnitude of Glyphosate Residues in Glyphosate Tolerant Canola Raw Agricultural Commodities Following Applications of a Glyphosate-Based Formulation 2009 Canadian Trials. Monsanto Study Number: REG-09-101, Report# MSL0022985. Unpublished study prepared by Monsanto, 241 pages.

2025588 2011, Magnitude of Glyphosate Residues in Glyphosate Tolerant Canola Raw Agricultural Commodities Following Applications of a Glyphosate-Based Formulation 2010 Canadian Trials. Monsanto Study Number: REG-10-026, Report# MSL0022986. Unpublished study prepared by Monsanto, 167 pages.

2025590	2011, Magnitude of Glyphosate Residues in Glyphosate Tolerant Canola Raw Agricultural Commodities Following Applications of a Glyphosate-Based Formulation. Monsanto Study Number: REG-09-091, Report# MSL0022984. Unpublished study prepared by Monsanto, 278 pages.
1924480	2009, Magnitude of Glyphosate Residues in corn Raw Agricultural Commodities Following Topical Application of a Glyphosate Based Formulation to Roundup Hybridization System (RHS) Seed Corn. US 2008 Trials, (MRID# 47982201) DACO: 7.2,7.4.1,7.4.2,7.4.6
2025590	2011, MSL 22984 Magnitude of Glyphosate Residues Following Topical Application of a Glyphosate Based Formulation, (MRID# 48358101) DACO: 7.2,7.4.1
2025582	2011, MSL 22985 Magnitude of Glyphosate Residues Following Topical Application of a Glyphosate Based Formulation, (MRID# 48358102) DACO: 7.2,7.4.1
2025588	2011, MSL 22986 Magnitude of Glyphosate Residues Following Topical Application of a Glyphosate Based Formulation, (MRID# 48358103) DACO: 7.2,7.4.1
2013875	2010, THE METABOLISM OF [14C]GLYPHOSATE IN 0827 CANOLA, (MRID# 48398601) DACO: 6.3
2006674 & 2006677	2010, Magnitude and Decline of Glyphosate Related REsidues in Forage and Seed Genetically Modified Canola Event DP-073496-4 and Magnitude of Glyphosate Related Residues in Canola Event DP-073496-4 Seed Process Fractions Following Applications of Touchdown (MRID# 48398602).
2256167	USEPA Memo: Data waivers and cross references for Livestock Metabolism, Enforcement Analytical Methodology and Multi-Residue Methodology Evaluation, 11/26/12.
2256173	2008, DER for Glyphosate Summary of Analytical Chemistry and Residue Data, DACO: 12.5.3,12.5.7
2256174	1997, Nature of Glyphosate Residues in Cotton Plants (Genotype Line #1445) Tolerant to Roundup Herbicide, Report# MSL-14113.
2256184	1995, Validation of a New Residue Method for Analysis of Glyphosate and Aminomethylphosphonic Acid (AMPA) - A Round-Robin Study, Report# MSL-4268.
2256185	1991, Storage Stability of Glyphosate Residues in Crop Commodities, Report# MSL-10843, 193 pages.
2256186	1995, Magnitude of Glyphosate Residues In Glyphosate-Tolerant Cotton Raw Agricultural and Processed Commodities, , Report# MSL-13884.
2256186	1995, Magnitude of Glyphosate Residues In Glyphosate-Tolerant Cotton Raw Agricultural and Processed Commodities, , Report# MSL-13884.
2256188	2003, Magnitude of Glyphosate Residues in Roundup Ready Flex Cotton Raw Agricultural Commodities Following Topical Applications of a Glyphosate-Based Formulation, Report# MSL-17635.
2256189	1974, Final Report on CP 67573, Residue and Metabolism Part 18:

	Determination of Residues in Meat, Milk and Eggs, Report# 326.

E. Studies Considered for the Environmental Risk Assessment

LIST OF STUDIES/INFORMATION SUBMITTED BY REGISTRANT

PMRA Document Number	Reference
1126906	Determination of the sorption & desorption properties of AMPA (MSL-12703; 206300; 252.0192.6135.710; 92-8-4390; 92-63-m8) final report (glyphosate), DACO: 8.2.4.1
1142749	Soil dissipation of alachlor, glyphosate, paraquat, simazine, cyanazine, atrazine and metribuzin following tank-mix applications under laboratory conditions (RD597;4612; MSL2073;7124), DACO: 8.2.4.1
1142750	Soil dissipation of alachlor, glyphosate, paraquat, linuron, maloran and diuron following tank-mix applications under laboratory conditions (RD597; 4612; MSL2118;7124), DACO: 8.2.4.1
1142751	Soil dissipation of alachlor, glyphosate and dynap following tank-mix applications under laboratory conditions (RD597; 4612; MSL2126; 7124), DACO: 8.2.4.1
1142752	Dissipation of glyphosate in field soils following minimum till application of roundup alone or in tank mix combinations with lasso me, atrazine, dyanap or metribuzin (RD597;4612;MSL-2422;7124), DACO: 8.2.4.1
1142753	Aerobic metabolism of [14C] glyphosate in sandy loam and silt loam soils with biometer flask (rd1031; PTRL1301; 368), DACO: 8.2.3.1
1142754	Aerobic aquatic metabolism of [14C] glyphosate (RD1030;MSL-10576; PTRL366), DACO: 8.2.3.1
1142755	Anaerobic aquatic metabolism of [14C] glyphosate (RD1029; PTRL367), DACO: 8.2.3.1
1142756	Persistence and dissipation of glyphosate in foliage and soils of a Canadian coastal watershed. J. Feng and D. Thompson. Proceedings of the carnation creek herbicide workshop. March,1989.(frda063; issn08350752; pages# 65-81), DACO: 8.3.2.3
1142757	Fate of glyphosate and its influence on nitrogen-cycling in two Finnish agriculture soils. M. Muller et.al. Bull. Environm. Contam. toxicol. (pages# 724-730) + Persistence, movement and degradation of glyphosate in selected Canadian boreal

	forest soils. D. Roy et.al. J. Agric. Food Chem. (pages# 437-440), DACO: 8.3.2.3
1142758	Dissipation of glyphosate in U.S. field soils following direct application of roundup herbicide (RD696; MSL-5901;MSL-3210;7163), DACO: 8.3.2.3
1142761	Dissipation of glyphosate in U.S. field soils following multiple applications of roundup herbicide (RD697;MSL-5902;MSL-3352;7163), DACO: 8.3.2.3
1142762	Roundup herbicide dissipation in cool climate forest soil and leaf litter (RD697;MSL-5902;MSL-2950;7163), DACO: 8.3.2.3
1142763	Dissipation of glyphosate and aminomethylphosphonic acid in forestry sites (RD993;MSL-9940), DACO: 8.3.2.3
1142764	Rapid dissipation of glyphosate in small forest ponds, DACO: 8.3.3.3
1142765	Behaviour of glyphosate in the aquatic environment. J. Bronstad and H. Friestad. Agricultural university of Norway, as-NLH, Norway. Chapter 13. (pages#200-205), DACO: 8.3.3.3
1142766	Aquatic dissipation of glyphosate and Ampa in water and soil sediment following application of glyphosate in irrigated crop and forestry uses (RD898;MSL-8332;066300)(cont'd on roll#1014), DACO: 8.3.3.3
1142767	Photodegradation and anaerobic aquatic metabolism of glyphosate, N-phosphono-methylglycine final report (RD924;MSL-0598;7863), DACO: 8.2.1,8.2.3.1
1142768	Addendum to MSL-3210-Dissipation of glyphosate in U.S. field soils following direct application of roundup herbicide final report (RD924; MSL-8081;066335), DACO: 8.3.2.3
1142769	Solubility, volatility, adsorption and partition coefficients, leaching and aquatic metabolism of MON 0573 and MON 0101 final report (RD181; MSL-0207;7863), DACO: 8.2.1,8.2.3.1,8.2.4.1
1142770	Photodegradation of 14C glyphosate in buffered aqueous solution at pH 5,7 and 9 by natural sunlight (RD 1020; MSL-10575;PTRL 233W-1), DACO: 8.2.1
1142771	Photodegradation of 14C glyphosate in/on soil by natural sunlight (RD972; MSL-9271;PTRL-153W), DACO: 8.2.1
1142773	Soil dissipation of Roundup, Lasso and Simazine herbicides (RD597; 4612; MSL-0064;7163), DACO: 8.2.4.1
1155370	Persistence, movement and degradation of glyphosate in selected Canadian boreal forest soils (RESID008; 437-440) Roy, Prasad et.al. (Roundup), DACO: 8.3.2.3
1155371	Fate of glyphosate in an Oregon forest ecosystem (ENVIR004; c1144-1151) Newton, Dubelman et.al. Journal of Agr. and Food Chemistry (Roundup), DACO: 8.3.2.3
1155372	Rapid dissipation of glyphosate in small forest ponds (AQUAT005;537-544) Goldsborough/Beck, Arch. Environ. Contam. toxicol. (roundup), DACO: 8.3.3.3
1155375	Fate of glyphosate in a Canadian forest watershed.2. Persistence in foliage and soils (RESID009;1118-1125) Feng/Thompson (Roundup), DACO: 8.3.2.3
1155377	Measurement of the environmental effects associated with forestry use of Roundup. Environment Canada Conservation and Protection environmental protection. Ernst/Hennigar et.al. (Ep-5-Ar-87-8;ENVIR006), DACO: 8.3.2.3

1161810 (14C)-glyphosate: adsorption/desorption in soil. Final report.(676/3;7180)., DACO: 8.2.4.2

1161812 Leaching characteristics of formulated 14C-glyphosate in three soils. (281430). DACO: 8.2.4.4

1161813 Degradation and metabolism of 14C-glyphosate in soil incubated under aerobic conditions.(246486)., DACO: 8.2.3.4.2

1161822 Determination of the degradability and persistence of 14C-glyphosate in the water/sediment-system.(ET01SE01)., DACO: 8.2.3.5.2,8.3.3.3

1161827 Hydrolysis determination of 14C-glyphosate (pmg) at different pH values. + First amendment to Report.(238500)., DACO: 8.2.3.2

1161828 Photodegradation study of 14C -glyphosate on soil. + protocol.(315764)., DACO: 8.2.3.3.1

1161829 Photodegradation study of 14C -glyphosate in water at pH 5, 7 and 9.(250751)., DACO: 8.2.3.3.2

1182629 1981, Roundup herbicide forest ecosystem study; part I: residues of glyphosate, amino-methylphosphonic acid and N-nitrosoglyphosate in forest soil and water following aerial application of Roundup herbicide. Final report. Date: March, 1981. Monsanto Canada inc. (MSL-1578; 7163). (PCP#13644 Environmental Chemistry volume 1 of 1), DACO: 8.3.2.2

1184806 MON-0573, residue and metabolism. Part 2: the photolysis, run-off, and leaching of MON-0573 on or in soil. DACO: 8.2.3.3.1,8.2.4.3.1

1184843 1982, Additional information to support the registration of roundup herbicide-forest ecosystem study; part II. DACO: 8.3.4

1184953 Final report on MON-0573, RESIDue and metabolism, part 2: the photolysis, run-off, and leaching of Mon-0573 on or in soil. DACO: 8.2.4.3.1

1202044 G-3780A Surfactant: biodegradation in natural waters, DACO: 8.3.3.3

1202045 G-3780A Surfactant: biodegradation, plant uptake & 14C-dist’n, DACO: 8.3.4

1202047 Environmental fate of the polyethoxylated tallow amine surfactant with 20 ethylene oxide units, DACO: 8.3.4

1213211 1996, [P-Methylene-14C] Glyphosate Acid: Aqueous Hydrolysis at pH 5, 7, and 9 and 25oC (WRC-96-003) (WINO 17973), DACO: 8.2.3.2

1213212 1996, [P-Methylene-14C] Glyphosate Acid: Photodegradation in/on Soil by Natural Sunlight, DACO: 8.2.3.3.1

1213213 1996, [P-Methylene-14C] Glyphosate Acid: Photodegradation in a Buffered Aqueous Solution at pH 5 and 7 by Natural Sunlight, DACO: 8.2.3.3.2

1213214 1996, [P-Methylene-14C] Glyphosate Acid: Aerobic Soil Metabolism, DACO: 8.2.3.4.2

1213217 2005, Note to the Reviewer: Glyphosate Phototransformation in Air, DACO: 8.2.3.3.3

1213218 1996, Glyphosate Acid: Adsorption and Desorption Properties in 5 Soils, DACO: 8.2.4.2

1213219 1996, Glyphosate Acid: Adsorption and Desorption Properties of the Major Metabolite, AMPA, in Soil, DACO: 8.2.4.2

1224531	2005, Glyphosate Acid: residue Levels in Soil After Application to Turf and to Bare Soil for Trials Conducted in California during 1995-1996 (WRC-98-112) (WINO 17976), DACO: 8.3.2
1226906	Leaching characteristics of aged CGA-12223 (1254), DACO: 8.2.4.1
1311111	2005, Environment Canada, unpublished pesticide science fund annual report 2004-2005. (water, air, plants, mammals and amphibians; and fish and birds.) DACO: 8.6
1311112	2004, Environment Canada, unpublished national water monitoring data. pesticide science fund (2004)., DACO: 8.6
1311129	2004, Manitoba water stewardship, unpublished water monitoring data from Manitoba (1991 - 2001), DACO: 8.6
1311130	2002, Manitoba conservation, Manitoba conservation (2002) unpublished water monitoring data collected in Manitoba (1990 - 2001), DACO: 8.6
1311131	2004, Manitoba water stewardship, unpublished water monitoring data from Manitoba (2001 - 2003), DACO: 8.6
1401896	2001, Urban Pesticide Monitoring Data - 2001.[Containing data on pesticide concentrations in eight Canadian tributaries of Lake Ontario.], DACO: 8.6
1401897	2001, Urban Pesticide Monitoring Data - 2000.[Containing data on pesticide concentrations in eight Canadian tributaries of Lake Ontario.], DACO: 8.6
1403269	2006, Environment Canada, pesticide science fund annual report 2005-2006., DACO: 8.6
1726638	Pesticide Science Fund Annual Report 2006-2007 DACO: 8.6, 9.9, DACO: 8.6,9.9
1726642	Pesticide Science Fund Annual Report 2007-2008 DACO 8.6, 9.9, DACO: 8.6,9.9
1971119	2010, Raw Unpublished Pesticide Science Fund Water Monitoring from Mill Creek British Columbia, DACO: 8.6
2032017	2011, A Summary of Relevant Existing Information on the Aquatic Toxicity of Glyphosate Acid, Glyphosate Salts, Glyphosate-based Formulations and Formulation Components to Amphibians and Fish, DACO: 9.9
2035772	Pesticides dans l’eau de surface d’une zone maraîchère Ruisseau Gibeault-Delisle dans les « terres noires » du bassin versant de la rivière Châteauguay de 2005 à 2007 Juin 2010, DACO: 8.6
2104739	2011, Evaluation of the Potential for Chronic Exposure to and Chronic Effects from Glyphosate Formulations, DACO: 9.9
2170903	PEI Department of Environment, Energy and forestry. (2010). Summary of Statistics from the PEI Groundwater Monitoring Program (2004 à 2009), notes from 2008 and the analyte list from 2009., DACO: 8.6
2171036	Ontario Ministry of the Environment. (2010). Unpublished groundwater monitoring data from Ontario’s Provincial Groundwater Monitoring Network. Received September 2011., DACO: 8.6
2469837	2013, Comparative toxicity of Glyphosate-Based Herbicides: Aqueous and Sediment Porewater Exposures - Report prepared for: National Contaminants Advisory Group, Ecosystem Science, Fisheries and Oceans Canada, DACO: 8.6,9.9

2469838 2013, Report 3: Preliminary Results and interpretations - Report prepared for: National Contaminants Advisory Group, Ecosystem Science, Fisheries and Oceans Canada, DACO: 8.2.3.5.4

790009 2002, MON 2139: Lemna minor growth inhibition test, DACO: 9.8.6

790011 2002, MON 78087 21 day toxicity test with the sedge, Carex comosa, DACO: 9.8.6

790012 2002, MON 78087 21 day toxicity test with the pickerel weed, Pontederia cordata, DACO: 9.8.6

790013 2002, MON 78087 21 day toxicity test with the pond lily, Nymphea odorata, DACO: 9.8.6

1126861 1991, Acute toxicity study of AMPA in rainbow trout. Final report (AB-90-402; 38987;MSL-10855;ML-90-403/EHL90187; Final raw data report# 38987R). (Glyphosate), DACO: 9.5.2.1

1142775 The toxicity of glyphosate technical to Selenastrum capricornutum (1092-02-1100-1;AABT-SEL-06;RD779), DACO: 9.8.2

1142776 The toxicity of glyphosate technical to Navicula pelliculosa (1092-02-1100-2;AABT-NAP-02;RD780), DACO: 9.8.2

1142777 The toxicity of glyphosate technical to Skeletonema costatum (1092-02-1100-3;AABT-SKL-04;RD781), DACO: 9.8.3

1142778 The toxicity of glyphosate technical to Anabaena flos-aquae (1092-02-1100-4;AABT-ANA-04;RD782), DACO: 9.8.2

1142779 The toxicity of glyphosate technical to Lemna gibba (1092-02-1100-5;PLSA-LEM-5;RD783), DACO: 9.8.2

1142807 1991, Acute toxicity of AMPA to Daphia magna. Final report, DACO: 9.3.1

1145595 An investigation of the toxicity of the technical material and soluble concentrate formulation 4LC-E (YF7712) to adult female Daphnia magna (RJ0679B;88JH299)(GLYPHOSATE), DACO: 9.3.1

1161830 Glyphosate technical: acute oral toxicity (ld50) to the bobwhite quail. (CHV48/91266; 58113), DACO: 9.6.2.1

1161834 Acute toxicity (LC50) study of glyphosate to earthworms.(250784), DACO: 9.2.3.1

1161835 Acute toxicity (LC50) study of glyphosate 360 to earthworms. (271664). (*note- no page#13 was included in this study), DACO: 9.2.3.1

1161839 48-Hour acute toxicity of glyphosate technical to Daphnia magna (OECD-immobilization test). (272968)., DACO: 9.3.1

1161840 48-Hour acute toxicity of glyphosate 360 to Daphnia magna (OECD-immobilization test).(272970)., DACO: 9.3.1

1161841 Glyphosate technical acute oral toxicity (ld50) to mallard duck (Anas platyrhynchos).(CHV49/91843)., DACO: 9.6.2.1

1161842 Influence of glyphosate 360 on the reproduction of Daphnia magna. (271697), DACO: 9.3.1

1161843 Influence of glyphosate on the reproduction of Daphnia magna. (250795)., DACO: 9.3.1

1161844 Acute Toxicity of Glyphosate 360 to *Scenedesmus Subspicatus* (OECD- Algae Growth Inhibition Test).(271675)., DACO: 9.8.2

1161845 Acute toxicity of glyphosate to Scenedesmus subspicatus (OECD- Algae growth inhibition test).(250773)., DACO: 9.8.2

1161847 LX1146-02 (Glyphosate technical) tier II non-target plant hazard evaluation-terrestrial vegetative vigor.(14625B018;1231-92-146-02-25B-16)., DACO: 9.8.4

1161848 Glyphosate technical tier II non-target plant hazard evaluation-terrestrial seed germination and seedling emergence.(14625B017;1231-92-146-02-25B-15)., DACO: 9.8.4

1161854 Glyphosate technical: 96-hour acute toxicity study (LC50) in the bluegill sunfish.(271642)., DACO: 9.5.2.1

1161866 Glyphosate 360: 96-hour acute toxicity study (LC50) in the bluegill sunfish. (271710)., DACO: 9.5.2.1

1161867 Glyphosate 360: 96-hour acute toxicity study (LC50) in the rainbow trout.(271708)., DACO: 9.5.2.1

1161868 Glyphosate technical: 96-hour acute toxicity study (LC50) in the rainbow trout.(271631)., DACO: 9.5.2.1

1161869 Glyphosate technical: 21-day prolonged toxicity study in the rainbow trout under flow-through conditions.(271620)., DACO: 9.5.3.1

1161870 Glyphosate 360: 21-day prolonged toxicity study in the rainbow trout under flow-through conditions.(271686)., DACO: 9.5.3.1

1164974 Toxicity of Glyphosate Technical to Aquatic Plant Organisms (Algae & Lemna). October,1987. Sub. Date: 96.02.16.(*Selenastrum Capricornutum, Navicula Pelliculosa, Skeletonema Costatum, Anabaena Flos-Aquae, Lemna Gibba*) (RD779-783;1092-02-1100-1;1092-02-1100-2;1092-02-1100-3; 1092-02-1100-4;1092-02-1100-5)., DACO: 9.8.2,9.8.3,9.8.5

1164975 An evaluation of the preemergence herbicidal activity of CP-70139. March, 1987. Submission date: February 16, 1996. (RD767;MSL-6574; 056337). (Roundup), DACO: 9.8.4

1164982 Tier 2 vegetative vigour non-target plant phytotoxicity study using glyphosate. (RD1219; 93235; MSL-13320). (Roundup), DACO: 9.8.4

1182523 Four-day static fish toxicity studies with CP67573 in rainbow trout and bluegills. DACO: 9.5.2.1,9.5.2.2

1182525 Four-Day Static Fish Toxicity Studies With MON2139 Formulation in Rainbow Trout and Bluegills. DACO: 9.5.2.1,9.5.2.2

1182526 Four-day static fish toxicity study with CP67573 in carp. DACO: 9.5.2.2

1182527 Exposure of fish to 14C-Roundup: accumulation, distribution, and elimination of 14C-residues. DACO: 9.5.6

1182528 Eight-day dietary LC50-bobwhite quail. Technical CP67573. DACO: 9.6.2.4

1182532 The acute contact and oral toxicities OF CP67573 and MON2139 to worker honey bees. DACO: 9.2.4.1,9.2.4.2

1182533 The acute toxicity of MON2139 to Daphnia. DACO: 9.3.2

1182534 Acute toxicity of roundup (technical) to atlantic oyster (Crassostrea virginica). DACO: 9.4.2

1182535 Acute toxicity of roundup (technical) to grass shrimp (Palaemonetes vulgaris) and fiddler crab (Uca pagilator). DACO: 9.4.2

1182536 Acute toxicity of roundup to bluegill (Lepomis Macrochirus). DACO: 9.5.2.2

1182538 1978, One-generation reproduction study-mallard duck. Glyphosate technical. Final report. (139-143). [Glyphosate;r.d.#211; special report# MSL-0577; 235924], DACO: 9.6.3.2

1182539 1978, One-generation reproduction study-bobwhite quail. Glyphosate technical. Final report [Glyphosate; submitted: November 13,1978; R.D.#211; special report# MSL-0577;235924], DACO: 9.6.3.1

1182542 1980, Acute toxicity of roundup to the water flea (Daphnia magna) [glyphosate; R.D.#350; special report# MSL-1548], DACO: 9.3.2

1182543 1980, Acute toxicity of roundup to channel catfish (Ictalurus punctatus) [glyphosate; R.D.#350; special report# MSL-1548], DACO: 9.5.2.2

1182544 1980, Acute Toxicity of Roundup to Rainbow Trout (Salmo Gairdneri). [Glyphosate;R.D.# 350;Special Report# MSL-1548], DACO: 9.5.2.1

1182545 1980, Acute toxicity of roundup to fathead minnow (Pimephales promelas). [glyphosate; R.D.#350; special report# MSL-1548], DACO: 9.5.2.1

1182546 1980, Acute toxicity of roundup to bluegill (Lepomis macrochirus) [glyphosate, r.d.#350;special report#MSL-1548], DACO: 9.5.2.2

1182547 Information to support the use of roundup (EPA 524-308) for weed control on or around aquatic sites and data in support of tolerance requests for glyphosate in potable water, fish and shellfish. DACO: 9.4.2,9.5.2.1

1182548 Combined data submission: application for an experimental use permit for Roundup (EPA reg.no.524-308) and petition for temporary tolerances for glyphosate in aquatic weed control. DACO: 9.5.5

1182549 Dynamic 96-hour acute toxicity of roundup to bluegill sunfish (Lepomis macrochirus). DACO: 9.5.2.2

1182550 Dynamic 96-hour acute toxicity of roundup to rainbow trout (Salmo gairdneri). DACO: 9.5.2.1

1182559 Dynamic 48-Hour Acute toxicity of Roundup to Grammarus Pseudolimnaeus. DACO: 9.3.2

1182570 Chronic toxicity of Glyphosate to Daphnia Magna Under Flow-Through Test Conditions. DACO: 9.3.3

1184692 Four-Day Static Fish Toxicity Studies With Mon2139 Formulation in Rainbow Trout and Bluegills. DACO: 9.5.2.1,9.5.2.2

1184694 Four-Day Static Fish Toxicity Studies With CP67573 in Rainbow Trout and Bluegills. DACO: 9.5.2.1, 9.5.2.2

1184697 Four-Day Static Fish Toxicity Study With CP67573 in Carp. DACO: 9.5.2.2

1184732 Dynamic 96-Hour Acute Toxicity of Roundup to Bluegill Sunfish (*Lepomis Macrochirus*). DACO: 9.5.2.2

1184732 Dynamic 96-Hour Acute Toxicity of Roundup to Bluegill Sunfish (*Lepomis Macrochirus*). DACO: 9.5.2.2

1184733 Dynamic 96-Hour Acute toxicity of Roundup to Rainbow Trout (Salmo Gairdneri). DACO: 9.5.2.1

1184734 Dynamic 48-Hour Acute Toxicity of Roundup To *Gammarus Pseudolimnaeus*. DACO: 9.3.2

1184735 Chronic Toxicity of Glyphosate to *Daphnia magna* Under Flow-Through Test Conditions. DACO: 9.3.3

1184737 Four-Day Static Fish Toxicity Study With Roundup in Carp. DACO: 9.5.2.2

1184740 Four-Day Static Fish toxicity Study with MON2139 in Channel Catfish. DACO: 9.5.2.2

1184764 The Acute toxicity of Glyphosate to Harlequin Fish (Rasbora Heteromorpha). DACO: 9.5.2.3

1184765 Four-Day Static Aquatic toxicity Study With MON2139 in Crayfish. DACO: 9.4.2

1184768 One-Generation Reproduction Study-Mallard Duck. Glyphosate. DACO: 9.6.3.2

1184798 The Acute Contact and Oral toxicities of CP67573 and MON2139 to Worker Honey Bees. DACO: 9.2.4.1,9.2.4.2

1184830 Four-Day Static Fish toxicity Studies With CP67573 in Rainbow Trout and Bluegills. DACO: 9.5.2.1,9.5.2.2

1184831 Four-Day Static Fish toxicity Studies With MON2139 formulation in Rainbow Trout and Bluegills. DACO: 9.5.2.1,9.5.2.2

1184937 Four-Day Static Fish Toxicity Studies With CP67573 in Rainbow Trout and Bluegills. DACO: 9.5.2.1,9.5.2.2

1184939 Four-Day Static Fish Toxicity Studies With MON2139 Formulation in Rainbow Trout and Bluegills. DACO: 9.5.2.1,9.5.2.2

1184940 Four-Day Static Fish Toxicity Study With CP67573 in Carp. DACO: 9.5.2.2

1184941 Exposure of Fish to 14C-Roundup: Accumulation, Distribution, and Elimination of 14C-Residues. DACO: 9.5.4

1184942 Eight-Day Dietary LC50-Bobwhite Quail. Technical CP67573. DACO: 9.6.2.4

1184947 The Acute Toxicity of MON2139 to *Daphnia*. DACO: 9.3.2

1184948 Acute Toxicity of Roundup (Technical) to Atlantic Oyster (*Crassostrea virginica*). DACO: 9.4.2

1184949 Acute Toxicity of Roundup (Technical) to Grass Shrimp (*Palaemonetes vulgaris*) and Fiddler Crab (*Uca pagilator*). DACO: 9.4.2

1184950 Acute Toxicity of Roundup to Bluegill (*Lepomis macrochirus*). DACO: 9.5.2.2

1193116 Summary And Final Report, MON 58121: A 48-Hour Flow-Through Acute toxicity Test With The Cladoceran (Daphnia Magna), DACO: 9.3.1,9.3.2

1193128 Summary and Final Report, MON 58121: A 96-Hour Flow-Through Acute toxicity Test With the Rainbow Trout (Oncorhynchus Mykiss). DACO: 9.5.1,9.5.2.1

1193139 Summary and Report, Mon 58121: an Acute Oral toxicity Study with the Northern Bobwhite, DACO: 9.6.1,9.6.2.1

1193140 Summary and Report, MON 58121: A Dietary LC50 Study With the Northern Bobwhite. DACO: 9.6.1,9.6.2.4

1205293 1986, Acute toxicity of roundup herbicide to chinook salmon, DACO: 9.5.2.1

1205294 1986, Acute Toxicity of Roundup Herbicide to Coho Salmon, DACO: 9.5.2.1

1205295 1986, Acute toxicity of roundup herbicide to rainbow trout, DACO: 9.5.2.1

1213224 1999, Glyphosate-potassium: toxicity of an SL formulation to the Earthworm Eisenia fetida in an Artificial Soil Test, DACO: 9.2.3.1

1213225 2000, Glyphosate Acid: A Laboratory investigation of the Effects of Glyphosate and its Breakdown Product AMPA on Reproduction in the Earthworm Eisenia fetida, DACO: 9.2.3.1

1213226 2000, AMPA: Acute toxicity of AMPA Technical Material to the Earthworm Eisenia andrei in an Artificial Soil Test, DACO: 9.2.3.1

1213227 1998, Glyphosate Acid: Acute Contact and Oral toxicity to Honey Bees (Apis mellifera), DACO: 9.2.4.1

1213228 1999, Amended report - Glyphosate Acid: Acute Contact and Oral toxicity to Honey Bees (Apis mellifera) of an SL formulation, DACO: 9.2.4.1

1213229 2000, Glyphosate: A Tier I Laboratory Study to Evaluate the Effects of an SL formulation on the Predatory Mite, Typhlodromus pyri (Acarina, Phytoseiidae), DACO: 9.2.5

1213230 2000, Glyphosate: A Tier II Extended Laboratory Study to Evaluate the Effects of an SL formulation on the Predatory Mite, Typhlodromus pyri (Acarina, Phytoseiidae), DACO: 9.2.5

1213231 2000, Glyphosate: A Tier I Laboratory Study to Evaluate the Effects of a SL formulation on the Carabid Beetle Poecilus cupreus (Coleoptera: Carabidae), DACO: 9.2.5

1213232 2001, Glyphosate : A Tier II Laboratory Study to Evaluate the Effect of a SL formulation on the Staphylinid Beetle, Aleochara bilineata Gyll. (Coleoptera, Staphylinidae), DACO: 9.2.5

1213233 2000, Glyphosate: A Tier I Laboratory Study to Evaluate the Effects of an SL formulation on the Green Lacewing, Chrysoperla carnea (Neuroptera, Chrysopidae), DACO: 9.2.5

1213234 2000, Glyphosate: A Tier I Laboratory Study to Evaluate the Effects of an SL formulation on the Parasitic Wasp, Aphidius rhopalosiphi (Hymenoptera, Braconidae), DACO: 9.2.6

1213235 2000, Glyphosate : A Tier II Extended Laboratory Study to Evaluate the Effects of an SL formulation on the Parastic Wasp, Aphidius rhopalosiphi (Hymenoptera, Braconidae), DACO: 9.2.6

1213236 2001, Glyphosate: A Tier II Laboratory Study to Evaluate the Effect of a SL formulation on the Hoverfly Episyrphus balteatus (Diptera: syrphidae), DACO: 9.2.6

1213237 1995, Glyphosate Acid: Acute toxicity to Daphnia magna, DACO: 9.3.2

1213238 1993, AMPA- Acute toxicity to Daphnia magna, DACO: 9.3.2

1213239 1998, Glyphosate Acid: Chronic toxicity to Daphnia magna, DACO: 9.3.3

1213240 1996, Glyphosate Acid: Acute toxicity to Mysid Shrimp (Mysidopsis bahia), DACO: 9.4.2

1213241 1996, Glyphosate Acid: Acute toxicity to Larvae of the Pacific Oyster (Crassostrea gigas), DACO: 9.4.3

1213242 1995, Glyphosate Acid: Acute toxicity to Rainbow Trout (Oncorhynchus mykiss), DACO: 9.5.2.1

1213243 1993, AMPA- Acute toxicity to Rainbow Trout, DACO: 9.5.2.1

1213244 1995, Glyphosate Acid: Acute toxicity to Bluegill Sunfish (Lepomis macrochirus), DACO: 9.5.2.2

1213245 2001, Glyphosate: Acute toxicity to Mirror Carp (Cyprinus carpio), DACO: 9.5.2.3

1213246 1996, Glyphosate Acid: Acute toxicity to Sheepshead Minnow (Cyprinodon variegatus), DACO: 9.5.2.4

1213248 1997, Glyphosate Acid: Acute Oral toxicity (LD50) to Bobwhite Quail, DACO: 9.6.2.1

1213249 1997, Glyphosate Acid: Dietary LC50 to the Bobwhite Quail, DACO: 9.6.2.4

1213250 1997, Glyphosate Acid: Dietary LC50 to the Mallard Duck, DACO: 9.6.2.5

1213251 1999, Glyphosate Acid: A Reproduction Study with the Northern Bobwhite (Colinus virginianus), DACO: 9.6.3.1

1213252 1999, Glyphosate Acid: A Reproduction Study with the Mallard (Anas platyrhynchos), DACO: 9.6.3.2

1213253 1995, Glyphosate Acid: toxicity to the Green Alga (Selenastrum capricornutum), DACO: 9.8.2

1213254 1996, Glyphosate Acid: toxicity to Blue-Green Alga (Anabaena flos-aquae), DACO: 9.8.2

1213255 1996, Glyphosate Acid: toxicity to the Freshwater Diatom Navicula pelliculosa, DACO: 9.8.2

1213256 1994, AMPA: Testing of toxic Effects of Aminomethyl Phosphonic Acid (AMPA) on the Single Cell Green Alga Scenedesmus subspicatus, DACO: 9.8.2

1213257 1999, Glyphosate: Toxicity to the Green Alga *Selenastrum capricornutum* of a 360g/L SL Formulation, DACO: 9.8.2

1213258 1996, Glyphosate Acid: Toxicity to the Marine Alga *Skeletonema costatum*, DACO: 9.8.3

1213259 1996, Glyphosate Acid: A Tier II Glasshouse Study to assess the Effects on Seedling Emergence of Terrestrial Non-target Plants, DACO: 9.8.4

1213260 1996, Glyphosate Acid: A Tier II Glasshouse Study to Assess the Effects on Vegetative Vigour of Terrestrial Non-target Plants, DACO: 9.8.4

1213261 1996, Glyphosate Acid: toxicity to Duckweed (Lemna gibba), DACO: 9.8.5

1414963 2003, Acute toxicity of CHA 4521 to Daphnia magna in 48-Hour Immobilization Test. Final Analytical Report to Acute toxicity of CHA 4521 to Daphnia magna in a 48-Hour Immobilization Test, DACO: 9.3,9.3.1,9.3.5

1414964 2003, Acute toxicity of CHA 4521 to Rainbow Trout (Oncorhynchus mykiss) in a 96-Hour Static Test. Final Analytical Report to: Acute toxicity of CHA 4521 to Rainbow Trout (Oncorynchus mykiss) in a 96-Hour Static Test, DACO: 9.5,9.5.1,9.5.4

1414965	2000, CHA 4520, CHA 4521, and CHA 45EXT (SL formulations with Glyphosate) : Alga, Growth inhibition Test with the Freshwater Algae Pseudokirchneriella Subcapitata, DACO: 9.8,9.8.1,9.8.6
1415025	2003, Acute toxicity of CHA 4525 to Daphnia magna in a 48-Hour Immobilization Test. Final Analytical Report to Acute toxicity of CHA 4525 to Daphnia magna in a 48-Hour Immobilization Test, DACO: 9.3,9.3.1,9.3.5
1415026	2003, Acute toxicity of CHA 4525 to Rainbow Trout (Oncorhynchus mykiss) in a 96-Hour Static Test. Final Analytical Report to: Acute toxicity of CHA 4525 to Rainbow Trout (Oncorhynchus mykiss) in a 96-Hour Static Test, DACO: 9.5,9.5.1,9.5.4
1415027	2003, toxicity of CHA 4525 to Pseudokirchneriella subcapitata in an Algal Growth inhibition Test. Final Analytical Report to toxicity of CHA 4525 to Pseudokirchneriella subcapitata in an Algal Growth inhibition Test, DACO: 9.8,9.8.1,9.8.6
1883054	1998, Effects of Sub-Lethal Rates of Roundup Herbicides on Green Ash, DACO: 9.8.7
2020241	2009, Biological Evaluation of the phytotoxicity of A12798QA - Diammonium-Glyphosate SL360 after soil Pre-Plant incorporation (PPI) and post emergence application, DACO: 9.8.4
2032017	2011, A Summary of Relevant Existing information on the Aquatic toxicity of Glyphosate Acid, Glyphosate Salts, Glyphosate-based formulations and formulation Components to Amphibians and Fish, DACO: 9.9
2134645	2011, A 96-hour Flow-Through Shell Deposition Test with the Eastern Oyster, DACO: 9.4.4,9.4.6
2134650	2011, A 96-hour Static Acute toxicity Test with the Sheepshead Minnow, DACO: 9.5.2.4,9.5.4
2162228	2012, A 96-hour Static Acute toxicity Test with the Saltwater Mysid (Americamysis bahia), DACO: 9.4.2,9.4.6
2162290	2012, Acute toxicity Test (Embryo-Larval) with Eastern Oyster (Crassostrea virginica) Under Static Conditions, DACO: 9.4.3,9.4.6
2201993	2011, Wetland Habitat Quality Study - Potential Effects of Glyphosate Herbibicide Applications on Forest Wetland and Amphibian Breeding Success - Annual Report - MNR Competitive Research Programs, DACO: 9.9
2203572	2012, Acute toxicity of Thirty Four Pesticide formulations to Amphibians, Fish, invertebrates, Bacteria, and Algae, and a Comparative Analysis of Their Relative Sensitivity, DACO: 9.9
2211852	2012, Glyphosate SL (A13013M) - Evaluation of the Phytotoxicity to Non Target Terrestrial Plant Vegetative Vigour Test, DACO: 9.8.4
2211858	2012, TK0060935, DACO: 9.8.4
2223076	2012, MON 2139: Acute toxicity Test (Embryo-Larval) with Eastern Oyster (Crassostrea virginica), DACO: 9.4.3,9.4.6

2223078 2012, MON 2139: A 96-Hour Static Acute toxicity Test with the Sheepshead Minnow (Cyprinodon variegatus), DACO: 9.5.2.4,9.5.4

2469799 2012, Effets des pesticides de la vigne sur le cycle biologique de l'escargot dans divers contextes d'exposition - , DACO: 9.2.7,9.3.4

2469803 2007, EPA DER of Bowman, J.H. 1991. Acute toxicity of AMPA to rainbow trout (Oncorhynchus mykiss) - EPA DER 43334713, DACO: 9.5.2.1

2469813 2013, Assessment of herbicide effect on terrestrial plants and habitats in agroecosystems - Final report submitted to the Pest Management regulatory Agency (Health Canada), DACO: 9.8.1

2469823 2012, Glyphosate: An Acute Oral toxicity Study with the Canary (Serinus canaria), DACO: 9.6.2.3

2469824 2012, MON 2139: a 96-Hour Shell Deposition Test with the Eastern Oyster (Crassostrea virginica), DACO: 9.4.4

2469825 2012, MON 2139: A 96-hour flow-through acute toxicity test with the white shrimp (Litopenaeous vannamei), DACO: 9.4.4

2469826 2012, MON 2139: A 96-hour static acute toxicity test with the saltwater mysid (Americamysis bahia), DACO: 9.4.2
